Message

I am pleased to know that the Centre of Societal Mission, IIT(ISM), Dhanbad is organizing the Skill Development Program on “Computer Awareness Programme” during September 17-21, 2018 in Phase-II.

Nowadays, elementary knowledge of computer application is indispensable for all round development of a person. This program will certainly enlighten the participant about the latest development and use of computer and its applications. This program has been conceived to disseminate knowledge related to wide range of computer applications touching every walk of life such as science, engineering, banking, business, administration etc. People of various age group will be able to extract knowhow about computer and in turn will be helpful in their day to day activities.

I would like to congratulate the organizers for this endeavor and extend my best wishes for success of the skill development program.

Message

It gives me immense pleasure to note that the Centre of Societal Mission, IIT(ISM), Dhanbad is organizing the Skill Development Program on “Computer Awareness Programme” during September 17-21, 2018 in Phase-II. In the present era of technological development, computer skill is indeed a basic requirement of each and every human being. This program will not only help in improving the quality of individuals but also benefit the participants in terms of creating awareness about practical knowledge of computer and its wider applications.

I wish the skill development program a grand success.

(A. K. Behura)

Ms-office Word

Introduction

Microsoft Office Word 2007 helps you produce professional-looking documents by providing a comprehensive set of tools for creating and formatting your document in a new interface. Rich review, commenting, and comparison capabilities help you quickly gather and manage feedback from colleagues. Advanced data integration ensures that documents stay connected to important sources of business information.

Features of Ms - Office 2007

1. Spend more time writing, less time formatting
2. Add preformatted elements with just a few clicks
3. Communicate more effectively with high-impact graphics
4. Instantly apply a new look and feel to your documents
5. Easily avoid spelling errors
6. Quickly compare two versions of a document
7. Convert your Word documents to PDF
8. Reduce file sizes and improve corruption recovery
9. Connect your documents to business information
10. Manage document properties in the Document Information Panel

Converting Documents

Convert a document to Office Word 2007

1. Click the Microsoft Office Button, and then click Convert.
2. In the Microsoft Office Word dialog box, click OK.
3. Do one of the following:
4. To replace the original file with a file in the Office Word 2007 file format, click the Microsoft Office Button, and then click Save.
5. To save the original document in its original file format and create another document in the Office Word 2007 file format, click the Microsoft Office Button, click Save As, and then type a new name for the file.

Use Word to open or save a file in another file format

You can use Microsoft Office Word 2007 to open or save files in other formats. For example, you can open a Web page and then upgrade it to access the new and enhanced features in Office Word 2007. For more information on upgrading

documents, see Use Microsoft Office Word 2007 to open documents created in previous versions of Word.

Open a file in Office Word 2007

You can use Office Word 2007 to open files in any of several formats.

1. Click the Microsoft Office Button , and then click Open.
2. In the Open dialog box, click the type of file that you want to open.
3. Click the file, and then click Open.

Save an Office Word 2007 file in another file format

You can save Office Word 2007 documents to any of several file formats.

1. Click the Microsoft Office Button , and then click Save As.
2. In the Save As dialog box, in the Save as type list, click the file type that you want.
3. In the File name box, type a name for the file.
4. Click Save.

Create a document to be used by previous versions of Word Turn on Compatibility Mode

When you create a new document that will be used in a previous version, you can turn on Compatibility Mode by saving the file in Word 97-2003 format.

1. Open a new document.
2. Click the Microsoft Office Button , and then click Save As.
3. Select Word 97-2003 Document in the Save as type list.
4. In the File name box, type a name for the document.
5. Click Save.

Document Writing

Select Text

In Microsoft Office Word 2007, you can select text or items in a table by using the mouse or the keyboard. You can also select text or items that are in different places. For example, you can select a paragraph on one page and a sentence on a different page.

Select text by using the mouse Select text in the body of a document

To select	Do this
Any amount of text	Click where you want to begin the selection, hold down the left mouse button, and then drag the pointer over the text that you want to select.
A word	Double-click anywhere in the word.
A line of text	Move the pointer to the left of the line until it changes to a right-pointing arrow, and then click.
A sentence	Hold down CTRL, and then click anywhere in the sentence.
A paragraph	Triple-click anywhere in the paragraph.
Multiple	Move the pointer to the left of the first paragraph until it changes to a right-pointing arrow, and then press and hold down the left mouse button

paragraphs	while you drag the pointer up or down.
A large block of text	Click at the start of the selection, scroll to the end of the selection, and then hold down SHIFT while you click where you want the selection to end.
An entire document	Move the pointer to the left of any text until it changes to a right-pointing arrow, and then triple-click.

Find text

You can quickly search for every occurrence of a specific word or phrase.

1. On the Home tab, in the Editing group, click Find.
2. In the Find what box, type the text that you want to search for.
3. Do one of the following:
 - To find each instance of a word or phrase, click Find Next.
 - To find all instances of a specific word or phrase at one time, click Find All, and then click Main Document.

Count the words as you type

When you type in a document, Office Word 2007 automatically counts the number of pages and words in your document and displays them on the status bar at the bottom of the workspace

Count the words in a selection or selections

Select the text that you want to count.

The status bar displays the number of words in the selection. For example, 100/1440 means that the section accounts for 100 words of the total number of words in the document, 1,440.

Insert a symbol or special character

You can use the Symbol dialog box to insert symbols, such as ¼ and ©, or special characters, such as an em dash (—) or ellipsis (...) that are not on your keyboard, as well as Unicode (Unicode: A character encoding standard developed by the Unicode Consortium. By using more than one byte to represent each character, Unicode enables almost all of the written languages in the world to be represented by using a single character set.) characters.

The types of symbols and characters that you can insert depend on the font that you choose. For example, some fonts may include fractions (¼), international characters (Ç, ë), and international monetary symbols (£, ¥). The built-in Symbol font includes arrows, bullets, and scientific symbols. You might also have additional symbol fonts, such as Wingdings, that include decorative symbols.

Insert a symbol

Click where you want to insert the symbol.

On the Insert tab, in the Symbols group, click Symbol.

Do one of the following:

Click the symbol that you want in the drop-down list.

- If the symbol that you want to insert is not in the list, click More Symbols. In the Font box, click the font that you want, click the symbol that you want to insert, and then click Insert.

2. Click Close.

Insert a special character

1. Click where you want to insert the special character.
2. On the Insert tab, in the Symbols group, click Symbol, and then click More Symbols.
3. Click the Special Characters tab.
4. Click the character that you want to insert, and then click Insert.
5. Click Close.

Insert a Unicode character

You can insert a Unicode character into a document by selecting a character from the Symbol dialog box or by typing the character code directly in a document.

Find a Unicode character code

When you select a Unicode character in the Symbol dialog box, its character code appears in the Character code box.

1. On the Insert tab, in the Symbols group, click Symbol, and then click More Symbols.
2. On the Symbols tab, in the Font box, click the font that you want.
3. In the from box, click Unicode (hex).
4. The Unicode character code is displayed in the Character code box

Use the keyboard to insert a Unicode character code in a document

If you know the character code, you can enter the code in your document and then press ALT+X to convert it into a character. For example, press 002A and then press ALT+X to produce *. The reverse also works. To display the Unicode character code for a character that is already in your document, place the insertion point directly after the character and press ALT+X.

Insert a predefined symbol by using AutoCorrect

Type a predefined AutoCorrect entry that is in the following list, and watch Microsoft Office Word automatically replace it with the appropriate symbol. For example, type -> to insert →.

Type	To insert
(c)	©
(r)	®
(tm)	™
...	⋯
:) or :-)	☺
: or :-	☹

:(or :-(

-->

<--

<==

<=>

==>

Turn on AutoCorrect

5. Click the Microsoft Office Button , and then click Word Options.
6. Click Proofing.
7. Under AutoCorrect options, click AutoCorrect Options, and then click the AutoCorrect tab.
8. Select the Replace text as you type check box.

Automatically insert the current date

Type the first four characters of the current month.

For example, type febr for February.

Microsoft Word displays the current month: February.

Press ENTER to insert the month, and then press SPACEBAR.

Word displays the current date – for example, February 12, 2008 or 12 February 2008.

Press ENTER to insert the entire date.

Insert a hyphen

Some of the content in this topic may not be applicable to some languages.

If a word is too long to fit at the end of a line, Microsoft Office Word 2007 moves the word to the beginning of the next line instead of hyphenating it. However, you can use the Hyphenation feature to automatically or manually hyphenate the text, insert optional or nonbreaking hyphens, and set the maximum amount of space allowed between a word and the right margin without hyphenating the word.

When you use automatic hyphenation, Office Word 2007 automatically inserts hyphens where they are needed. When you use manual hyphenation, Word searches for the text to hyphenate and asks you whether you want to insert the hyphens in the text.

Automatically hyphenate an entire document

When you use automatic hyphenation, Office Word 2007 automatically inserts hyphens where they are needed. If you later edit the document and change line breaks, Office Word 2007 will rehyphenate the document.

1. Make sure that no text is selected.
2. On the Page Layout tab, in the Page Setup group, click Hyphenation, and then click Automatic.

Remove hyphenation

Some of the content in this topic may not be applicable to some languages.

You can remove all automatic hyphenation and each instance of manual hyphenation, such as optional and nonbreaking hyphens.

Remove automatic hyphenation

On the Page Layout tab, in the Page Setup group, click Hyphenation, and then click None.

Automatically correct capitalization

Your Microsoft Office program can make your work easier by automatically correcting capitalization errors. The default options usually work well for most people, so you may not need to modify these options. However, if it is necessary, you can easily customize the automatic capitalization options.

Note Text included in hyperlinks is not automatically corrected.

Automatically correct capitalization

You can enable or disable the various ways that the program automatically corrects capitalization.

1. Do one of the following in these Microsoft Office programs:

Word, Excel, PowerPoint, or Access

1. Click the Microsoft Office Button , and then click Program Name Options, where Program Name is the name of the program you are in, for example, Word Options.
2. Click Proofing.
3. Click AutoCorrect Options.
 - Correct TWo INitial CApitals
 - Capitalize first letter of sentences
 - Capitalize names of days
 - Correct accidental use of cAPS LOCK key

- Capitalize first letter of table cells (not available in Microsoft Office Access, Excel)

Turn off overtype mode:

1. Click the Microsoft Office Button , and then click Word Options.
2. Click Advanced.
3. Under Editing options, clear the Use overtype mode check box.

Use automatic formatting as you type

Automatic formatting can make entering certain kinds of text faster and easier. The specific options that are available depend on the program that you are using. To see and modify automatic formatting options, do the following:

1. Do one of the following in these Microsoft Office programs:

Word, Excel, or PowerPoint

1. Click the Microsoft Office Button , and then click Program Name Options, where Program Name is the name of the program you are in, for example, Word Options.
2. Click Proofing.

You can use the DELETE key to clear text and graphics.

1. Select the text or graphics that you want to delete.
2. Press the DELETE

Select text by using the mouse and the keyboard

1. Click where you want to begin the selection.
2. Using the scroll bars, click the scroll arrows or drag the scroll boxes until you see the place where you want to end the selection.
3. Hold down the SHIFT key while you click where you want to end the selection.

Insert text from another file

1. Click where you want to insert the text.
2. On the Insert tab, in the Text group, click the arrow next to Object, and then click Text from File.
3. In the Insert File dialog box, locate the file that you want, and then double-click it.

Automatically correct spelling with words from the main dictionary

You can set up your program to automatically correct misspelled words that are similar to words in the main dictionary that the spelling checker uses.

Enable AutoCorrect to use the main dictionary that the spelling checker uses

When you install Microsoft Office, AutoCorrect is set by default to try to match and correct a misspelled word with a word in the main dictionary that the spelling checker uses. However, if you want to make sure this option is enabled.

1. Do one of the following in these Microsoft Office programs:

Word

1. Click the Microsoft Office Button , and then click Word Options.
2. Click Proofing.
3. Click AutoCorrect Options.

On the AutoCorrect tab, select the automatically use suggestions from the spelling checker check box.

Specify an AutoCorrect exception manually

1. On the AutoCorrect tab, click Exceptions, and then click the Other Corrections tab.
2. Type the misspelled word in the don't correct box. Click Add, and then click OK.

Write or insert an equation

You can type an equation in yo

ur document or insert an equation in the following ways:

- Choose from a list of frequently used or preformatted equations
- Insert or type symbols
- Insert commonly used mathematical structures

Write an equation

To write an equation, you can use Unicode character codes and Math AutoCorrect entries to replace text with symbols. For more information, see Insert a symbol or special character.

When you type an equation, Word automatically converts the equation into a professionally formatted equation.

1. On the **Insert** tab, in the **Symbols** group, click the arrow next to **Equations**, and then click **Insert New Equation**.
2. Type an equation.

Change an equation

Change an equation that was written in Office Word 2007

Click the equation that you want to edit.

Make the changes that you want.

Convert a professionally formatted equation into an equation on one line

Convert an equation

Select the equation.

Under Equation Tools, on the Design tab, in the Tools group, click **Linear**.

Insert mathematical symbols

Some of the content in this topic may not be applicable to some languages.

In Microsoft Office Word 2007, you can insert mathematical symbols into equations.

On the Insert tab, in the Symbols group, click the arrow next to Equations, and then click Insert New Equation.

Under Equation Tools, on the Design tab, in the Symbols group, click the More arrow .

Click the arrow next to the name of the symbol set, and then click the name of the symbol set that you want to display.

Click the symbol that you want to insert.

Use Math AutoCorrect rules outside of an equation

Click the Microsoft Office Button , and then click Word Options.

Click Proofing, and then click AutoCorrect Options.

Click the Math AutoCorrect tab.

Select the Use Math AutoCorrect rules outside of math regions check box.

Spelling, Grammar, and Thesaurus

Check spelling and grammar

Some of the content in this topic may not be applicable to some languages.

As a deadline approaches, often there is not enough time to check a document for spelling and grammar mistakes. Your Microsoft Office program provides tools that can help you correct these mistakes faster. You decide if you want to set up the Microsoft Office program so that you can easily see potential mistakes while you work. Or, if you find the wavy red and green lines distracting, you can just check your document when you are ready to finish it.

Check spelling and grammar automatically (wavy red, blue, and green lines)

Maybe you are looking for a way to find and fix spelling mistakes in your document more quickly and easily? Or maybe you don't want to see the wavy red lines that your Microsoft Office program displays in your document? This section explains how automatic spelling and grammar checking works and how to turn it on or off.

Look up words in the dictionary

Using the Research feature, you can look up words in the dictionary.

1. Do the following in these Microsoft Office programs:

Excel, PowerPoint, or Word

- On the Review tab, click Research.

2. Do one of the following:

- To look up a single word in the document, press ALT and click the word that you want to look up.

Look up words in the thesaurus

Using the Research feature, you can look up synonyms (different words with the same meaning) and antonyms (words with the opposite meaning) in the thesaurus.

1. Do the following in these Microsoft Office programs:

Excel, PowerPoint, or Word

- On the Review tab, click Thesaurus.

2. Press ALT and click the word that you want to look up. Results appear in the Research task pane.

3. To use one of the words in the list of results or to search for more words, do one of the following:

- To use one of the words, point to it, click the down arrow, and then click Insert or Copy.

Automatically correct spelling and insert text and symbols by using words in a l

You can use the AutoCorrect feature to correct typos and misspelled words, as well as to insert symbols and other pieces of text. AutoCorrect is set up by default with a list of typical misspellings and symbols, but you can modify the list that AutoCorrect uses.

Display the Grammar Settings dialog box

Do the following in one of these Microsoft Office programs:

Word

1. Click the Microsoft Office Button , and then click Word Options.

2. Click Proofing.
3. Under When correcting grammar in Word, click Settings.

Add a word or phrase to your custom dictionary

When you use the spelling checker, it compares the words in your document with those in its main dictionary. The main dictionary contains most common words, but it may not include proper names, technical terms, acronyms, and so on. In addition, some words may be capitalized differently in the main dictionary than in your document. Adding such words or capitalization to a custom dictionary prevents the spelling checker from flagging them.

Word

1. Select the text that you want the spelling and grammar checker to ignore.
2. On the Review tab, in the Proofing group, click Set Language.
3. Select the Do not check spelling or grammar check box.
4. Optionally, you can create a special style that is based on the selected text:
 1. Right-click the selection, and then click Save Selection as a New Quick Style on the shortcut menu.
 2. Give the style a name — for example, code — and then click OK.

Enable custom dictionaries

You can use the Custom Dictionaries dialog box to manage your custom dictionaries. However, none of the settings in this dialog box take effect unless you enable custom dictionaries.

1. Do the following in one of these Microsoft Office programs:

Word, Excel, PowerPoint, or Access

 1. Click the Microsoft Office Button  , and then click Program Name Options.
 2. Click Proofing.
2. Make sure the Suggest from main dictionary only check box is cleared.
3. Click Custom Dictionaries.
4. In the Custom Dictionaries dialog box, for any custom dictionaries you want to use, make sure the check box next to each of those dictionaries is selected.

Hide spelling and grammar errors in a Word document

You may have a Word document in which you don't want to see the spelling and grammar errors flagged with wavy red and green lines, or you may prefer that none of the documents that you create show the spelling and grammar errors.

1. Click the Microsoft Office Button  , and then click Word Options.

2. Click Proofing.

Lists

Create a bulleted or numbered list

You can quickly add bullets or numbers to existing lines of text, or Word can automatically create lists as you type.

By default, if you start a paragraph with an asterisk or a number 1., Word recognizes that you are trying to start a bulleted or numbered list..

Lists: One level or many levels

Make a list with just one level, or make a multilevel list to show lists within a list.

When you create a bulleted or numbered list, you can do any of the following:

- Use the convenient Bullet and Numbering libraries Use the default bullet and numbering formats for lists, customize the lists, or select other formats from the Bullet and Numbering libraries.
- Format bullets or numbers Format bullets or numbers differently from the text in a list. For example, click a number and change the number color for the entire list, without making changes to the text in the list.
- Use pictures or symbols Create a picture bulleted list to add visual interest to a document or a Web page.

Create a one-level bulleted or numbered list

Word can automatically create bulleted and numbered lists as you type, or you can quickly add bullets or numbers to existing lines of text.

Type a bulleted or numbered list

1. Type * (asterisk) to start a bulleted list or 1. to start a numbered list, and then press SPACEBAR or the TAB key.
2. Type any text that you want.
3. Press ENTER to add the next list item.

Word automatically inserts the next bullet or number.

4. To finish the list, press ENTER twice, or press BACKSPACE to delete the last bullet or number in the list.

Create a multilevel list

1. A multilevel list shows the list items at different levels rather than at one level.

2. You can pick a multilevel list style from the gallery, or you can create a new multilevel list style.

Choose a multilevel list style from the gallery

1. Click where you want to begin your list.
2. On the Home tab, in the Paragraph group, click the arrow next to Multilevel List.
3. Click a multilevel list style in the gallery of styles.
4. Type your list. Press the TAB key or SHIFT+TAB to change level.

Turn on or off automatic bullets or numbering

By default, if you type an asterisk or a number 1., Word recognizes that you are trying to start a bulleted or numbered list. You can turn off the automatic list recognition feature.

1. Click the Microsoft Office Button , and then click Word Options.
2. Click Proofing.
3. Click AutoCorrect Options, and then click the AutoFormat As You Type tab.
4. Under Apply as you type, select or clear the Automatic bulleted lists check box or the Automatic numbered lists check box.

Choose a new bullet or numbering format

1. Click a bullet or number in the list that you want to change.

In a multiple-level list, you can change the formatting one level at a time by clicking one bullet or number at that level in the list.

2. On the Home tab, under Paragraph, click the arrow next to Bullets or Numbering.
3. Click the bullet or numbering list format that you want in the Bullet Library or the Numbering Library.

Change the font for bullets or numbers in a list

You can change the text formatting of bullets or numbers in a list without making changes to the text in the list. For example, you can format numbers or bullets with a different font color than the text in the list.

1. Click a bullet or number in a list.

All the bullets or numbers in the list are selected.

2. On the Home tab, in the Font group, make the changes that you want.

Add picture bullets or symbols to a list

The Bullet Library includes symbol and picture bullet styles. If you don't see the style that you want in the library, you can define a new bullet style.

1. Select the items to which you want to add picture bullets or symbols.

To change an entire list level in a multilevel list, click one bullet or number at that level in the list.

2. On the Home tab, in the Paragraph group, click the arrow next to Bullets.
3. Click Define New Bullet, and then click Symbol or Picture.
4. Click any symbol or picture that you want to use, and then click OK twice.

Convert bullets to numbers or vice versa in a list

1. Click a bullet or number in the list that you want to change.

By clicking a bullet or number in an automatically recognized bulleted or numbered list, you select the entire list.

2. On the Home tab, in the Paragraph group, click Bullets or Numbering.

To change the list back, click either Bullets or Numbering.

Combine lists into one list

You can combine a new list with an existing list by typing the content for the new list. Word automatically formats the new list to continue the previous list.

You can also combine existing lists. When you add one existing list to another, Word automatically formats the second list to match the formatting of the first list.

1. Select the list that you want to combine with another list.
2. Press CTRL+X or CTRL+C.
3. Click the line below the list that you want to add to.
4. Press CTRL+V.

Formatting

Change Text Formatting

Make text bold

1. Select the text that you want to make bold, and move your pointer to the Mini toolbar above your selection.
2. Click Bold.

Keyboard shortcut CTRL+B

Underline text

The quickest way to underline text is to press CTRL+U and start typing. When you want to stop underlining, press CTRL+U again.

You can also underline text and spaces in several other ways.

Underline words and the spaces between them

Underline words, but not the spaces between them

Use a double underline

Underline blank spaces

Add a decorative underline

Double underline the text

1. Select the text that you want to underline.
2. On the Home tab, click the Font Dialog Box Launcher, and then click the Font tab.
3. In the Underline style box, click the double underline style.

Change the text color

1. Select the text that you want to change, and move your pointer to the Mini toolbar that appears with your text selection.
2. Click Font Color, and then select the color that you want.

Change the text size

1. Select the text that you want to change, and move your pointer to the Mini toolbar that appears with your text selection.
2. Do one of the following:
 - To make the text larger, click Grow Font. Or press CTRL+SHIFT+>.
 - To make the text smaller, click Shrink Font. Or press CTRL+SHIFT+<.

Note You can also specify a font size on the Home tab, in the Font group.

Apply or remove highlighting

Use the Highlight tool to mark and find important text in your document. Highlighted parts of a document are easiest to see when the document is online.

Start highlighting

1. On the Home tab, in the Font group, click the arrow next to Text Highlight Color.
2. Click the color that you want.

Note Use a light highlight color if you plan to print the document by using a monochrome or dot-matrix printer.

3. Select the text or graphic that you want to highlight.
4. To stop highlighting, click the arrow next to Text Highlight Color and click Stop Highlighting, or press ESC.

Highlight selected text

1. Select the text that you want to highlight.
2. On the Home tab, in the Font group, click the arrow next to Text Highlight Color.
3. Click the color that you want.

Note Use a light highlight color if you plan to print the document by using a monochrome or dot-matrix printer.

Remove highlighting from part or all of a document

1. Select the text that you want to remove highlighting from, or press CTRL+A to select all of the text in the document.
2. On the Home tab, in the Font group, click the arrow next to Text Highlight Color.
3. Click No Color.

Apply single-line strikethrough formatting

1. Select the text that you want to change.
2. On the Home tab, click the Font Dialog Box Launcher, and then click the Font tab.
3. Select the Strikethrough check box.

Apply double-line strikethrough formatting

1. Select the text that you want to change.
2. On the Home tab, click the Font Dialog Box Launcher, and then click the Font tab.
3. Select the Double strikethrough check box.

Create a large dropped initial capital letter

The dropped cap, a large dropped initial capital letter, can be used to begin a document or a chapter, or to add interest to a newsletter or invitation.

Dropped cap

In-margin dropped cap

1. Click in the paragraph that you want to begin with a drop cap.

The paragraph must contain text.

2. On the Insert tab, in the Text group, click Drop Cap.
3. Click Dropped or In margin.

Make text superscript or subscript

Superscript and subscript refer to numbers that are positioned slightly higher or slightly lower than the text on the line. For example, a footnote or endnote number reference is an example of superscript, and a scientific formula might use subscript text.

Superscript

Subscript

Make text superscript or subscript

1. Select the text that you want to format as superscript or subscript.
2. Do one of the following:
 - On the Home tab, in the Font group, click Superscript. Or press CTRL+SHIFT+=.
 - On the Home tab, in the Font group, click Subscript. Or press CTRL+=.

Animate the text

You can not apply text animation effects in Office Word 2007. However, text animation effects that were applied to text in an earlier version of Word can be viewed in Office Word 2007.

1. Open a document with text effects applied in an earlier version of Word.
2. Select some text with the animation effect that you want to use, and then press CTRL+C to copy the text.
3. Open a new document or click in the current document where you want the text animation effect to continue.
4. Press CTRL+V to paste the text where you want to continue using the same text animation effect.
5. Continue typing.

To stop using the text animation style, remove the text animation effects.

Align the text left or right

1. Select the text that you want to align.
2. On the Home tab, in the Paragraph group, click Align Left or Align Right .

Center the text

1. Select the text that you want to center.
2. On the Home tab, in the Paragraph group, click Center .

Justify the text

You can justify the text, which might make the last line of text in a paragraph considerably shorter than the other lines.

1. Select the text you want to justify.
2. On the Home tab, in the Paragraph group, click Justify .

Center the text between the top and bottom margins

1. Select the text that you want to center between the top and bottom margins.
2. On the Page Layout tab, click the Page Setup Dialog Box Launcher, and then click the Layout tab.
3. In the Vertical alignment box, click Center.
4. In the Apply to box, click Selected text, and then click OK.

Double-space the entire document

1. On the Home tab, in the Styles group, right-click Normal, and then click Modify.
2. Under Formatting, click Double Space.

Formatting for the entire document changes to double spacing.

Line spacing options

Single This option accommodates the largest font (font: A graphic design applied to all numerals, symbols, and alphabetic characters. Also called type or typeface. Arial and Courier New are examples of fonts. Fonts usually come in different sizes, such as 10 point, and various styles, such as bold.) in that line, plus a small amount of extra space. The amount of extra space varies depending on the font that is used.

1.5 lines This option is one-and-one-half times that of single line spacing.

Double This option is twice that of single line spacing.

At least This option sets the minimum line spacing that is needed to fit the largest font or graphic on the line.

Exactly This option sets fixed line spacing that Microsoft Office Word does not adjust.

Multiple This option sets line spacing that is increased or decreased from single spacing by a percentage that you specify. For example, setting line spacing to 1.2 will increase the space by 20 percent.

Change the spacing before or after paragraphs

By default, spacing is increased slightly following paragraphs.

Select the paragraphs before or after which you want to change the spacing.

On the Page Layout tab, in the Paragraph group, click an arrow next to Spacing Before or Spacing After and enter the amount of space that you want.

Indent paragraphs

Indentation determines the distance of the paragraph from either the left or the right margin. Within the margins, you can increase or decrease the indentation of a paragraph or group of paragraphs. You can also create a negative indent (also known as an outdent), which pulls the paragraph out toward the left margin. You can also create a hanging indent, in which the first line of the paragraph is not indented, but subsequent lines are.

Page margins

Indentation

Wrap text around a picture or drawing object

1. If the picture or object is on a drawing canvas (drawing canvas: An area on which you can draw multiple shapes. Because the shapes are contained within the drawing canvas, they can be moved and resized as a unit.), select the canvas. If the picture or object is not on a drawing canvas, select the picture or object.
2. On the Format tab, in the Arrange group, click Position.

If you don't see Position, click Arrange, and then click Position.

3. Click the wrapping position that you want to apply.

Wrap text around a table

1. Click the table.
2. Under Table Tools, on the Layout tab, in the Table group, click Properties.
3. Under Text Wrapping, click Around.

To set the horizontal and vertical position of the table, the distance from surrounding text, and other options, under Text Wrapping, click Positioning, and then choose the options that you want.

Change Spacing or Alignment

Set the tab stops

You might want to use the ruler to set manual tab stops at the left side, middle, and right side of your document.

You can quickly set tabs by clicking the tab selector at the left end of the ruler until it displays the type of tab that you want and then clicking the ruler at the location you want. But which type of tab stop should you use?

A Left Tab stop sets the start position of text that will then run to the right as you type.

A Center Tab stop sets the position of the middle of the text. The text centers on this position as you type.

A Right Tab stop sets the right end of the text. As you type, the text moves to the left.

A Decimal Tab stop aligns numbers around a decimal point. Independent of the number of digits, the decimal point will be in the same position. (You can align numbers around a decimal character only; you cannot use the decimal tab to align numbers around a different character, such as a hyphen or an ampersand symbol.)

A Bar Tab stop doesn't position text. It inserts a vertical bar at the tab position.

If you want your tab stops at precise positions that you can't get by clicking the ruler, or if you want to insert a specific character (leader) before the tab, you can use the Tabs dialog box. To display this dialog box, double-click any tab stop on the ruler.

About using the horizontal ruler to set tab stops

By default, there are no tab stops on the ruler when you open a new blank document.

The final two options on the tab selector are actually for indents. You can click these and then click the ruler to position the indents, rather than sliding the indent markers along the ruler. Click First Line Indent , and then click the upper half of the horizontal ruler where you want the first line of a paragraph to begin. Click Hanging Indent , and then click the lower half of the horizontal ruler where you want the second and all following lines of a paragraph to begin.

When you set a bar tab stop, a vertical bar line appears where you set the tab stop (you don't need to press the TAB key). A bar tab is similar to strikethrough formatting, but it runs vertically through your paragraph at the location of the bar tab stop. Like other types of tabs, you can set a bar tab stop before or after you type the text of your paragraph.

You can remove a tab stop by dragging it (up or down) off the ruler. When you release the mouse button, the tab stop disappears.

You can also drag existing tab stops left or right along the ruler to a different position.

When multiple paragraphs are selected, only the tabs from the first paragraph show on the ruler.

Portions of this article were excerpted from Training on Microsoft Office Online.

Add formatting to your document by using the Mini toolbar

When you select text, you can show or hide a handy, miniature, semitransparent toolbar called the Mini toolbar. The Mini toolbar helps you work with fonts, font styles, font sizing, alignment, text color, indent levels, and bullet features.

The following shows the Mini toolbar when you rest your pointer on it. To use the toolbar, click any of the available commands.

Create a hyperlink

Microsoft Office Word creates a hyperlink for you when you press ENTER or the SPACEBAR after you type the address of an existing Web page, such as www.contoso.com.

Click to follow hyperlinks

Hide All

By default, you follow – or open – hyperlinks (hyperlink: Colored and underlined text or a graphic that you click to go to a file, a location in a file, a Web page on the World Wide Web, or a Web page on an intranet. Hyperlinks can also go to newsgroups and to Gopher, Telnet, and FTP sites.) by pressing CTRL while clicking the hyperlink. If you prefer, you can set hyperlinks so that you follow the hyperlinks by just clicking them.

Click the Microsoft Office Button , and then click Word Options.

Click Advanced.

Under Editing options, clear the Use CTRL+ Click to follow hyperlink check box.

Create a customized hyperlink to a document, file, or Web page

Select the text or picture that you want to display as the hyperlink.

On the Insert tab, in the Links group, click Hyperlink .

You can also right-click the text or picture and then click Hyperlink on the shortcut menu.

Do one of the following:

To link to an existing file or Web page, click Existing File or Web Page under Link to, and then type the address that you want to link to in the Address box. If you don't know the address for a file, click the arrow in the Look in list, and then navigate to the file that you want.

To link to a file that you haven't created yet, click Create New Document under Link to, type the name of the new file in the Name of new document box, and then, under When to edit, click Edit the new document later or Edit the new document now.

Quick Formatting

Apply a style

Applying a style to a selection of text in Microsoft Office Word 2007 is as easy as clicking a button in the Quick Styles gallery.

1. Select the text to which you want to apply a style.

For example, you can select text that you want to make into a heading. If you want to change the style for an entire paragraph, click anywhere in the paragraph.

On the Home tab, in the Styles group, click the style that you want. If you don't see the style that you want, click the More button  to expand the Quick Styles gallery.

For example, if you select text that you want to style as a title, click the style called Title in the Quick Styles gallery.

Create a new Quick Style

Select the text that you want to create as a new style.

For example, perhaps you want the word business always to appear as bold and red in your document.

On the Mini toolbar that appears above your selection, click Bold and Red to format the text.

Right-click the selection, point to Styles, and then click Save Selection as a New Quick Style.

Give the style a name – for example, business – and then click OK.

The business style that you created appears in the Quick Styles gallery with the name you gave it, ready for you to use whenever you want text to be bold and red.

Change a style

In Microsoft Office Word 2007, Quick Styles are sets of styles that are designed to work together to create an attractive and professional looking document. In most cases, you won't change styles in a Quick Style set because the styles have been designed to complement one another, and it's easier to use a different Quick Style set. But, under certain circumstances, you might want to change the attributes of a style in a Quick Style set.

Select text that is styled with the style attributes that you want to change.

For example, to change the attributes of the Heading 1 style, select text that has the Heading 1 style applied.

Remove a style from the Quick Styles gallery

On the Home tab, in the Styles group, right-click the style that you want to remove from the gallery.

Click Remove from Quick Styles gallery.

Use the Format Painter

Hide All

You can use the Format Painter on the Write tab to apply text formatting and some basic graphics formatting, such as borders and fills.

Select the text or graphic that has the formatting that you want to copy.

On the Home tab, in the Clipboard group, click Format Painter.

The pointer changes to a paintbrush icon.

Select the text or graphic that you want to format.

To stop formatting, press ESC.

Restrict formatting changes

You can use document protection to help restrict how others can change the formatting of your document.

On the Review tab, in the Protect group, click Protect Document, and then click Restrict Formatting and Editing.

In the Protect Document task pane, under Formatting restrictions, select the Limit formatting to a selection of styles check box, and then click Settings to specify which styles others can apply or change.

Under Styles, make sure that the Limit formatting to a selection of styles check box is selected.

Select the check boxes next to the styles that you want to allow in the document.

Under Formatting, select the check boxes next to the types of formatting that you want to allow or prevent.

Click OK.

If you receive a message stating that your document may contain formatting or styles that are not allowed, do one of the following:

Click Yes to remove styles and formatting that are not allowed – for example, styles that you did not select in the Formatting Restrictions dialog box.

Click No to keep the formatting or styles in the document. Note that users will not be able to use the styles or formatting when they edit the document.

Under Start enforcement, click Yes, Start Enforcing Protection.

To assign a password to the document so that only people who know the password can remove the protection, type a password in the Enter new password (optional) box, and then confirm the password.

Margins and Page Setup

Change or set page margins

Page margins are the blank space around the edges of the page. In general, you insert text and graphics in the printable area between the margins. However, you can position some items in the margins – for example, headers, footers, and page numbers.

Page margin options

Microsoft Word offers several page margin options. You can use the default (default: A predefined setting. You can accept the default option settings, or you can change them to suit your own preferences.) page margins or you can specify your own.

Add margins for binding Use a gutter margin to add extra space to the side or top margin of a document that you plan to bind. A gutter margin helps ensure that text isn't obscured by the binding.

Gutter margins for binding

Mirror margins for facing pages

Set margins for facing pages Use mirror margins to set up facing pages for double-sided documents, such as books or magazines. In this case, the margins of the left page are a mirror image of those of the right page (that is, the inside margins are the same width and the outside margins are the same width).

Note You can set gutter margins for a document that has mirror margins if the document needs extra space for binding.

Add a book fold using the Book fold option in the Page Setup dialog box, you can create a booklet. You can use the same option to create a menu, invitation, event program, or any other type of document that uses a single center fold.

Word inserts a single, center book fold

After you set up a document as a booklet, you work with it just as you would any document, inserting text, graphics, and other visual elements.

Notes

Change or set page margins

On the Page Layout tab, in the Page Setup group, click Margins.

Click the margin type that you want. For the most common margin width, click Normal.

When you click the margin type that you want, your entire document automatically changes to the margin type that you have selected.

You can also specify your own margin settings. Click Margins, click Custom Margins, and then in the Top, Bottom, Left

Select page orientation

You can choose either portrait (vertical) or landscape (horizontal) orientation for all or part of your document. When you change the orientation, the galleries of predesigned page and cover page options also change to offer pages that have the orientation that you choose.

Change the orientation of your entire document

On the Page Layout tab, in the Page Setup group, click Orientation.

Click Portrait or Landscape.

Use portrait and landscape orientation in the same document

Select the pages or paragraphs that you want to change to portrait or landscape orientation.

Note If you select some but not all of the text on a page to change to portrait or landscape orientation, Word places the selected text on its own page, and the surrounding text on separate pages.

On the Page Layout tab, in the Page Setup group, click Margins.

Click Custom Margins.

On the Margins tab, click Portrait or Landscape.

In the Apply to list, click Selected text.

Show or hide the rulers

The horizontal and vertical rulers in Word are often used to align text, graphics, tables, and other elements in a document.

To view the horizontal ruler across the top of your Word document and the vertical ruler along the left edge of your document, you must be in Print Layout view (Print Layout view: A view of a document or other object as it will appear when you print it. For example, items such as headers, footnotes, columns, and text boxes appear in their actual positions.).

Show or hide the horizontal and vertical rulers

To show or hide the horizontal and vertical rulers, click View Ruler at the top of the vertical scroll bar.

Note The vertical ruler will not appear if it is turned off. To turn on the vertical ruler, do the following:

Click the Microsoft Office Button , and then click Word Options.

Click Advanced.

Under Display, select the Show vertical ruler in Print Layout view check box.

Headers and Footers

Insert headers and footers

Headers and footers are areas in the top, bottom, and side margins (margin: The blank space outside the printing area on a page.) of each page in a document.

You can insert or change text or graphics in headers and footers. For example, you can add page numbers, the time and date, a company logo, the document title or file name, or the author's name.

If you want to change a header or footer that you inserted, the Headers & Footers tab under Header & Footer Tools gives you more header and footer options.

Working with headers and footers in a document without sections

In a simple document without sections, you can insert, change, and remove headers and footers.

Insert or change the headers or footers

You can insert predesigned headers or footers in your document and easily change the header and footer designs. Or you can create your own header or footer with a company logo and custom look, and save the new header or footer to the gallery.

Insert the same header and footer throughout a document

On the Insert tab, in the Header & Footer group, click Header or Footer.

Click the header or footer design that you want.

The header or footer is inserted on every page of the document.

Insert text or graphics in a header or footer and save it to the gallery

On the Insert tab, in the Header & Footer group, click Header or Footer.

Click Edit Header or Edit Footer.

Insert text or graphics.

To save the header or footer that you created to the gallery of header or footer options, select the text or graphics in the header or footer, and then click Save Selection as New Header or Save Selection as New Footer.

Change headers or footers

On the Insert tab, in the Header & Footer group, click Header or Footer.

Click a header or footer design from the gallery.

The header or footer design changes for the entire document.

Remove the header or footer from the first page

On the Page Layout tab, click the Page Setup Dialog Box Launcher, and then click the Layout tab.

Select the Different first page check box under Headers and footers.

Headers and footers are removed from the first page of the document.

Make the headers or footers different for odd and even pages

For example, you might choose to use the title of the document on odd pages, and the chapter title on even pages.

On the Page Layout tab, click the Page Setup Dialog Box Launcher, and then click the Layout tab.

Select the Different odd and even check box.

Now you can insert the header or footer for even pages on an even page and the header or footer for odd pages on an odd page.

Change the contents of a header or footer

On the Insert tab, in the Header & Footer group, click Header or Footer.

Make your changes to the header or footer by selecting the text and revising it or by using the options on the Mini toolbar to format the text. For example, you can change the font, apply bold format, or apply a different font color.

Remove the headers or footers

Click anywhere in the document.

On the Insert tab, in the Header & Footer group, click Header or Footer.

Click Remove Header or Remove Footer.

The header or footers are removed from the entire document.

Page Numbers

Page Numbers

Insert page numbers

Hide All

You can add page numbers, which are associated with headers and footers, to the top, the bottom, or the margins of a document. Information that is stored in headers and footers or margins appears dimmed, and it cannot be changed at the same time as the information in the body of the document.

Insert page numbers

You can choose from various page numbering designs that are available in the gallery.

Insert page numbers or Page X of Y page numbers

On the Insert tab, in the Header & Footer group, click Page Number.

Click Top of Page, Bottom of Page, or Page Margins, depending on where you want page numbers to appear in your document.

Choose a page numbering design from the gallery of designs. The gallery includes Page X of Y options.

Format page numbers

After you add page numbers, you can change them just as you might change text in a header or footer. Change the format of the page number, the font, or the size.

Change the page-number format, such as 1, i, or a

Double-click the header or footer of one of your document pages.

Under Header & Footer Tools, on the Design tab, in the Header & Footer group, click Page Number, and then click Format Page Numbers.

In the Number format box, click a numbering style, and then click OK.

Change the font and size of page numbers

Double-click the header, footer, or page margins of one of your document pages.

Select the page number.

On the Mini toolbar that appears above the selected page number, do one of the following:

To change the font, click a font name in the box .

To make the font size larger or smaller, do one of the following:

To make the text larger, click Grow Font. Or press CTRL+SHIFT+>.

To make the text smaller, click Shrink Font. Or press CTRL+SHIFT+<.

Start or restart the page numbering

Start the page numbering with a different number

For example, if you add a cover page to a document with page numbers, the second page is automatically numbered page 2. You might want the document to begin with page 1.

Click anywhere in the document.

On the Insert tab, in the Header & Footer group, click Page Number.

Click Format Page Numbers.

In the Start at box, enter a number.

Remove page numbers

Microsoft Office Word 2007 automatically removes or deletes page numbers when you click Remove Page Numbers or when you remove a single page number manually from the document.

On the Insert tab, in the Header & Footer group, click Page Number.

Click Remove Page Numbers.

Viewing and Navigating

Viewing and Navigating

Read documents in Word

Full Screen Reading view is optimized for reading a document on the computer screen. In Full Screen Reading view, you also have the option of seeing the document as it would appear on a printed page.

Read a document

On the View tab, in the Document Views group, click Full Screen Reading.

Page through the document

You can use any of the following options to move from page to page in a document:

Click the arrows in the lower corners of the pages.

Press PAGE DOWN and PAGE UP or SPACEBAR and BACKSPACE on the keyboard.

Click the navigation arrows at the top center of the screen.

Zoom in or out of a document

You can zoom in to get a close-up view of your document or zoom out to see more of the page at a reduced size.

Quickly zoom in or out of a document

On the status bar, click the Zoom slider

Slide to the percentage zoom setting that you want.

Choose a particular zoom setting

You can choose how much of a document you view on the screen. Do one of the following:

On the View tab, in the Zoom group, click Zoom 100%.

- On the View tab, in the Zoom group, click One Page, Two Pages, or Page Width.
- On the View tab, in the Zoom group, click Zoom, and then enter a percentage or choose any other settings that you want.

Compare documents side by side

For more information about how to compare revisions in a pair of documents, see Merge comments and changes from several documents into 1 document.

1. Open both of the files that you want to compare.
2. On the View tab, in the Window group, click View Side by Side.

Show or hide formatting marks

Show or hide formatting marks

On the Home tab, in the Paragraph group, click Show/Hide.

The Show/Hide button doesn't turn off all formatting marks

The Show/Hide button will not hide all formatting marks if you selected certain marks, such as paragraph marks or spaces, to be displayed at all times.

Turn off selected formatting marks

Click the Microsoft Office Button , and then click Word Options.

Click Display.

Under Always show these formatting marks on the screen, clear the check boxes for any formatting marks that you do not want to show in your documents at all times

Tables

Tables

Insert a blank line before a table

Use this procedure to insert a blank line before a table that is on the first line of the first page in a document.

Click in the upper-left cell in the first row of the table.

Press ENTER.

Insert or Create a Table

Insert a table

In Microsoft Office Word 2007, you can insert a table by choosing from a selection of preformatted tables – complete with sample data – or by selecting the number of rows and columns that you want. You can insert a table into a document, or you can insert one table into another table to create a more complex table.

Use table templates

You can use table templates to insert a table that is based on a gallery of preformatted tables. Table templates contain sample data to help you visualize what the table will look like when you add your data.

Click where you want to insert a table.

1. On the Insert tab, in the Tables group, click Table, point to Quick Tables, and then click the template that you want.
2. Replace the data in the template with the data that you want.

Use the Table menu

1. Click where you want to insert a table.
2. On the Insert tab, in the Tables group, click Table, and then, under Insert Table, drag to select the number of rows and columns that you want.

Use the Insert Table command

You can use the Insert Table command to choose the table dimensions and format before you insert the table into a document.

Click where you want to insert a table.

On the Insert tab, in the Tables group, click Table, and then click Insert Table.

Under Table size, enter the number of columns and rows.

Under AutoFit behavior, choose options to adjust the table size.

Create a table

You can create a table by drawing the rows and columns that you want or by converting text to a table.

Draw a table

You can draw a complex table – for example, one that contains cells of different heights or a varying number of columns per row.

Click where you want to create the table.

On the Insert tab, in the Tables group, click Table, and then click Draw Table.

The pointer changes to a pencil.

To define the outer table boundaries, draw a rectangle. Then draw the column lines and row lines inside the rectangle.

To erase a line or block of lines, under Table Tools, on the Design tab, in the Draw Borders group, click Eraser.

Click the line that you want to erase. To erase the entire table, see Delete a table or clear its contents.

When you finish drawing the table, click in a cell and start typing or insert a graphic.

Convert text to a table

Insert separator characters – such as commas or tabs – to indicate where you want to divide the text into columns. Use paragraph marks to indicate where you want to begin a new row.

For example, in a list with two words on a line, insert a comma or a tab after the first word to create a two-column table.

Select the text that you want to convert.

On the Insert tab, in the Tables group, click Table, and then click Convert Text to Table.

In the Convert Text to Table dialog box, under Separate text at, click the option for the separator character that you used in the text.

Select any other options that you want.

Place a table inside another table

Tables that are inside other tables are called nested tables and are often used to design Web pages. If you think of a Web page as one big table that holds other tables – with text and graphics inside different table cells – you can lay out the different parts of your page.

You can insert a nested table by clicking in a cell and then using any of the methods to insert a table, or you can draw a table where you want the nested table.

Note You can also copy and paste an existing table into another table.

Add a cell, row, or column to a table

Add a cell

Click in a cell that is to the right of or above where you want to insert a cell.

Under Table Tools, on the Layout tab, click the Rows & Columns Dialog Box Launcher.

Click one of the following options.

Click	To
Shift cells right	Insert a cell and move all other cells in that row to the right. Note Word does not insert a new column. This may result in a row that has more cells than the other rows.
Shift down cells	Insert a cell and move the existing cells down one row. A new row is added at the bottom of the table.
Insert entire row	Insert a row above the cell that you clicked in.
Insert entire column	Insert a column to the left of the cell that you clicked in.

Add a row above or below

Click in a cell above or below where you want to add a row.

Under Table Tools, on the Layout tab, do one of the following:

To add a row above the cell, click Insert Above in the Rows and Columns group.

To add a row below the cell, click Insert Below in the Rows and Columns group.

Add a column to the left or right

Click in a cell to the left or right of where you want to add a column.

Under Table Tools, on the Layout tab, do one of the following:

To add a column to the left of the cell, click Insert Left in the Rows and Columns group.

To add a column to the right of the cell, click Insert Right in the Rows and Columns group.

Delete a cell, row, or column from a table

Delete a cell

Select the cell that you want to delete by clicking its left edge.

Under Table Tools, click the Layout tab.

In the Rows & Columns group, click Delete, and then click Delete Cells.

Click one of the following options:

Click	To do this
Shift left cells	Delete a cell and shift all other cells in that row to the left. Note Word does not insert a new column. Using this option may result in a row that has fewer cells than the other rows.
Shift cells up	Delete a cell and move the remaining existing cells in that column up one row each. A new, blank cell is added at the bottom of the column.
Delete entire row	Delete the entire row that contains the cell that you clicked in.
Delete entire column	Delete the entire column that contains the cell that you clicked in.

Delete a row

Select the row that you want to delete by clicking its left edge.

Under Table Tools, click the Layout tab.

In the Rows & Columns group, click Delete, and then click Delete Rows.

Delete a column

Select the column that you want to delete by clicking its top gridline or top border.

Under Table Tools, click the Layout tab.

In the Rows & Columns group, click Delete, and then click Delete Columns.

Merge or split cells in a table

Merge cells

You can combine two or more table cells located in the same row or column into a single cell. For example, you can merge several cells horizontally to create a table heading that spans several columns.

Select the cells that you want to merge by clicking the left edge of a cell and then dragging across the other cells that you want.

Under Table Tools, on the Layout tab, in the Merge group, click Merge Cells.

Split cells

Click in a cell, or select multiple cells that you want to split.

Under Table Tools, on the Layout tab, in the Merge group, click Split Cells..

Enter the number of columns or rows that you want to split the selected cells into.

Move or copy a table Hide All

Drag a table to a new location

In Print Layout view , rest the pointer on the table until the table move handle appears.

Rest the pointer over the table move handle until the pointer becomes a four-headed arrow, and then click the table move handle.

Drag the table to a new location.

Copy a table and paste it in a new location

When you paste a table in a new location, you can copy the table or cut it. When you copy a table, the original table remains in place. When you cut a table, the original table is deleted.

In Print Layout view , rest the pointer on the table until the table move handle appears.

Click the table move handle to select the table.

Do one of the following:

To copy the table, press CTRL+C.

To cut the table, press CTRL+X.

Place the insertion point where you want the new table.

Press CTRL+V to paste the table in the new location.

Move or copy items in a table

On the Home tab, in the Paragraph group, click Show/Hide.

Select the item that you want to move or copy.

To select	Do this
A cell	Click the left edge of the cell.
A row	Click to the left of the row.
A column	Click the column's top gridline or top border.

Do one of the following:

To move the selected item, drag it to the new location.

To copy the selected item, hold down CTRL while you drag it to the new location.

Formatting Tables

Formatting Tables

Format a table

After you create a table, Microsoft Office Word 2007 offers you many ways to format that table. If you decide to use Table Styles, you can format your table all at once, and even see a preview of what your table will look like formatted in a particular style before you actually apply the style.

You can create a custom look for tables by splitting or merging cells, adding or deleting columns or rows, or adding borders. If you're working with a long table, you can repeat the table headings on each page on which the table appears. To prevent awkward page breaks that disrupt the flow of your table, you can also specify just how and where the table should break across pages.

Use Table Styles to format an entire table

After you create a table, you can format the entire table by using Table Styles. By resting your pointer over each of the preformatted table styles, you can preview what the table will look like.

Click in the table that you want to format.

Under Table Tools, click the Design tab.

In the Table Styles group, rest the pointer over each table style until you find a style that you want to use.

Note To see more styles, click the More arrow .

Click the style to apply it to the table.

In the Table Style Options group, select or clear the check box next to each the table element to apply or remove the selected style.

Add or remove borders

You can add or remove borders to format a table the way that you want.

Add table borders

Under Table Tools, click the Layout tab.

In the Table group, click Select, and then click Select Table.

Under Table Tools, click the Design tab.

In the Table Styles group, click Borders, and then do one of the following:

Click one of the predefined border sets.

Click Borders and Shading, click the Borders tab, and then choose the options that you want.

Remove table borders from the whole table

Under Table Tools, click the Layout tab.

In the Table group, click Select, and then click Select Table.

Under Table Tools, click the Design tab.

In the Table Styles group, click Borders, and then click No Border.

Add table borders to specified cells only

On the Home tab, in the Paragraph group, click Show/Hide.

Select the cells that you want, including their end-of-cell marks.

Under Table Tools, click the Design tab.

In the Table Styles group, click Borders, and then click the border that you want to add.

Remove table borders from specified cells only

On the Home tab, in the Paragraph group, click Show/Hide.

Select the cells that you want, including their end-of-cell marks.

Under Table Tools, click the Design tab.

In the Table Styles group, click Borders, and then click No Border.

Display or hide gridlines

Gridlines show the cell boundaries of a table on the screen wherever the table doesn't have borders applied. If you hide the gridlines in a table that has borders, you won't see the change because the gridlines are behind the borders. To view the gridlines, remove the borders.

Unlike borders, gridlines appear only on the screen; they are never printed. If you turn off gridlines, the table is displayed as it will be printed.

Note Gridlines are not visible when you view a document in a Web browser or in Print Preview.

Display or hide table gridlines in a document

Under Table Tools, on the Layout tab, in the Table group, click View Gridlines.

Sort the contents of a table

In Print Layout view (Print Layout view: A view of a document or other object as it will appear when you print it. For example, items such as headers, footnotes, columns, and text boxes appear in their actual positions.), move the pointer over the table until the table move handle appears.

Click the table move handle to select the table that you want to sort.

Under Table Tools, on the Layout tab, in the Data group, click Sort.

In the Sort dialog box, select the options that you want.

Sort a single column in a table

Select the column that you want to sort.

Under Table Tools, on the Layout tab, in the Data group, click Sort.

Under My list has, click Header row or No header row.

Click Options.

Under Sort options, select the Sort column only check box.

Click OK.

Repeat a table heading on subsequent pages

When you work with a very long table, it will be divided into several pages. You can make adjustments to the table so that the table headings appear on each page.

Repeated table headings are visible only in Print Layout view (Print Layout view: A view of a document or other object as it will appear when you print it. For example, items such as headers, footnotes, columns, and text boxes appear in their actual positions.) or when you print the document.

1. Select the heading row or rows. The selection must include the first row of the table.
2. Under Table Tools, on the Layout tab, in the Data group, click Repeat Header Rows.

Tracking Changes and Comments

Track changes while you edit

You can easily make and view tracked changes and comments while you work in a document. By default, Microsoft Office Word 2007 uses balloons to display deletions, comments, formatting changes, and content that has moved. If you want to see all of your changes inline, you can change settings so that tracked changes and comments display the way you want.

Balloons show formatting changes, comments, and deletions.

Track changes while you edit

Open the document that you want to revise.

On the Review tab, in the Tracking group, click the Track Changes image.

To add a track changes indicator to the status bar, right-click the status bar and click Track Changes. Click the Track Changes indicator on the status bar to turn track changes on or off.

Make the changes that you want by inserting, deleting, moving, or formatting text or graphics. You can also add comments.

Turn off change tracking

On the Review tab, in the Tracking group, click the Track Changes image.

If you customized the status bar to include a track changes indicator, clicking Track Changes in the Tracking group will also turn off the indicator in the status bar.

Insert a comment

You can type a comment. On a Tablet PC (Tablet PC: A computer that runs Microsoft Windows XP Tablet PC Edition. With a Tablet PC, you can write directly on the screen by using a tablet pen and use the pen to perform mouse functions. Also known as a tablet computer.), you can insert a voice comment or a handwritten comment.

Type a comment

Select the text or item that you want to comment on, or click at the end of the text.

On the Review tab, in the Comments group, click New Comment.

Type the comment text in the comment balloon or in the Reviewing Pane.

Let reviewers insert comments only

On the Review tab, in the Protect group, click Protect Document, and then click Restrict Formatting and Editing.

In the Protect Document task pane, under Editing restrictions, select the Allow only this type of editing in the document check box.

In the list of editing restrictions, click Comments.

If you want to give some people editing options for specific pieces of the document, you can select areas in the document, and then choose which users (a group or individuals) can edit the selected areas of the document. Click the dropdown arrow next to the group or individual name to find the next region or all regions that the group or individual can edit, or to remove permissions for the group or individual.

Under Start enforcement, click Yes, Start Enforcing Protection.

To assign a password to the document so that only reviewers who know the password can remove the protection, type a password in the Enter new password (optional) box, and then confirm the password.

Stop protection for comments and changes

On the Review tab, in the Protect group, click Protect Document, and then click Restrict Formatting and Editing.

In the Protect Document task pane, click Stop Protection.

Review each tracked change and comment in sequence

On the Review tab, in the Changes group, click Next or Previous.

Do one of the following:

In the Changes group, click Accept.

In the Changes group, click Reject.

In the Comments group, click Delete.

Accept or reject changes and delete comments until there are no more tracked changes or comments in your document.

To ensure all tracked changes are accepted or rejected and that all comments are deleted, on the Review tab, in the Tracking group, click Reviewing Pane. The summary section at the top of the Reviewing Pane displays the exact number of tracked changes and comments that remain in your document.

Hide tracked changes and comments when printing

Hiding changes does not remove changes from the document. You must use the Accept and Reject commands in the Changes group to remove markup from your document.

Click the Microsoft Office Button , and then click Print.

In the Print what box, click Document (instead of Document showing markup).

Print a document with tracked changes and comments showing

Before you print the document, switch to Print Layout view (Print Layout view: A view of a document or other object as it will appear when you print it. For example, items such as headers, footnotes, columns, and text boxes appear in their actual positions.) and display the tracked changes (tracked change: A mark that shows where a deletion, insertion, or other editing change has been made in a document.) and comments (comment: A note or annotation that an author or reviewer adds to a document. Microsoft Word displays the comment in a balloon in the margin of the document or in the Reviewing Pane.) the way that you want them to appear in the printed document. You have several options.

Print showing all markup On the Review tab, in the Tracking group, click Show Markup.

Note Clicking Show Markup displays or hides all markup (markup: Comments and tracked changes such as insertions, deletions, and formatting changes. View markup when you want to process tracked changes and comments. Print a document with markup to keep a record of changes made to a document.) in the document for selected reviewers. When you display all markup, all types of markup are selected on the Show Markup menu.

Print showing changes and comments by type or reviewer On the Review tab, in the Tracking group, click Show Markup, and then select the type of change that you want to display.

Print changes and comments for an editor or other reviewer On the Review tab, in the Tracking group, in the Display for Review box, click Final Showing Markup.

When the markup appears the way that you want it to, you are ready to print the document.

Click the Microsoft Office Button , and then click Print.

In the Print dialog box, in the Print what box, click Document showing markup, and then click OK.

Turn on or off change tracking

You can customize the status bar to add an indicator that tells you when change tracking is on or off. When the Track Changes feature is on, you can view all of the changes that you make in a document. When you turn off the Track Changes feature, you can make changes to a document without marking what has changed.

Turn on change tracking

On the Review tab, in the Tracking group, click the Track Changes image.

To add a track changes indicator to the status bar, right-click the status bar and click Track Changes. Click the Track Changes indicator on the status bar to turn Track Changes on or off.

Note If the Track Changes command is unavailable, you might have to turn off document protection. On the Review tab, in the Protect group, click Protect Document, and then click Stop Protection at the bottom of the Protect Document task pane. (You might need to know the document password.)

Turn off change tracking

When you turn off change tracking, you can revise the document without marking what has changed. Turning off the Track Changes feature does not remove any changes that have already been tracked.

Important To remove tracked changes, use the Accept and Reject commands on the Review tab in the Changes group.

On the Review tab, in the Tracking group, click the Track Changes image.

To add a track changes indicator to the status bar, right-click the status bar and click Track Changes. Click the Track Changes indicator on the status bar to turn track changes on or off.

Merge and Compare Documents

Merge comments and changes from several documents into 1 document

If you send a document for review to several reviewers, and each reviewer returns the document, you can combine the documents two at a time until all the reviewer changes have been incorporated into a single document.

On the Review tab, in the Compare group, click Compare.

Click Combine revisions from multiple authors.

Under Original document, click the name of the document into which you want to combine the changes from multiple sources.

If you don't see the document in the list, click Browse for Original .

Under Revised document, browse for the document that contains the changes by one of the reviewers.

Click More.

Under Show changes, select the options for what you want to compare in the documents.

By default, Microsoft Office Word shows changes to whole words. For example, if you change the word cat to cats, the entire word cats will show as changed in the document and not simply the character s.

Under Show changes in, click Original document.

Click OK.

To change which documents appear on the screen when you click OK, in the Compare group, click Hide Source Documents or Show Source Documents.

Repeat steps 1-8. Word will merge all of the changes into the original document.

Compare documents with the legal black line option

The legal blackline option compares two documents and displays only what changed between them. The documents that are being compared are not changed. The legal blackline comparison is displayed by default in a new third document.

If you want to compare changes from a number of reviewers, do not select this option. Click Combine revisions from multiple authors instead.

On the Review tab, in the Compare group, click Compare.

Click Compare two versions of a document (legal blackline).

Under Original document, browse for the document that you want to use as the original document.

Under Revised document, browse for the other document that you want to compare.

Click more, and then select the settings for what you want to compare in the documents. Under Show changes, choose whether you want to show character or word level changes.

If you do not want to display changes in a third document, choose which document you want the changes to appear in.

Click OK.

If either version of the document has tracked changes, Microsoft Office Word displays a message box. Click Yes to accept the changes and compare the documents.

1. Microsoft Office Word displays a new third document in which tracked changes in the original document are accepted, and changes in the revised document are shown as tracked changes.

The source documents that are being compared are not changed.

Working with Graphics and charts

Brand a document with a watermark or background

Learn about watermarks and backgrounds

Watermarks are text or pictures that appear behind document text. They often add interest or identify the document status, such as marking a document as a Draft. You can see watermarks in Print Layout view and Full Screen Reading view or in a printed document.

Add a watermark or a background

Add a text watermark to document

Watermarks can be viewed only in Print Layout and Full Screen Reading views and on the printed page.

You can insert a predesigned watermark from a gallery of watermark text, or you can insert a watermark with custom text.

On the Page Layout tab, in the Page Background group, click Watermark.

Do one of the following:

Click a predesigned watermark, such as Confidential or Urgent, in the gallery of watermarks.

Click Custom Watermark, click Text watermark and then select or type the text that you want. You can also format the text.

To view a watermark as it will appear on the printed page, use Print Layout view.

Add a background color or texture to a Web page or an online document

On the Page Layout tab, in the Page Background group, click Page Color.

Do any of the following:

Click the color that you want under Theme Colors or Standard Colors.

Click Fill Effects to change or add special effects, such as gradients, textures, or patterns.

Note Select the color that you want before you apply a gradient or pattern.

Turn a picture into a background or watermark

You can turn a picture, clip art, or a photo into a watermark that you can use to brand or decorate a document.

On the Page Layout tab, in the Page Background group, click Watermark.

Click Printed Watermark.

Click Picture watermark, and then click Select Picture.

Select the picture that you want, and then click Insert.

Select a percentage under Scale to insert the picture at a particular size

Select the Washout check box to lighten the picture so that it doesn't interfere with text.

The picture that you selected is applied as a watermark to the entire document.

Change a watermark or a background

On the Page Layout tab, in the Page Background group, click Watermark.

Do one of the following:

Choose a different predesigned watermark, such as Confidential or Urgent, from the gallery of watermarks.

To change pictures, click Printed Watermark, and then click Select Picture.

To change picture settings, click Printed Watermark, and then select or clear the options Picture watermark.

To change text, click Printed Watermark, and then select a different built-in phrase or type in your own phrase.

To change text settings, click Printed Watermark, and then select or clear the options that you want under Text watermark.

Change a document background

You can apply a different color, apply a texture or picture instead of color, or change settings for patterns and gradients.

On the Page Layout tab, in the Page Background group, click Page Color.

Do one of the following:

Click the new color that you want under Theme Colors or Standard Colors.

Click Fill Effects to change or add special effects, such as gradients, textures, or patterns.

Note Select the color that you want before you apply a gradient or pattern.

Remove a watermark or a background

Do one of the following:

Remove a watermark

On the Page Layout tab, in the Page Background group, click Watermark.

Click Remove Watermark.

Remove a background

On the Page Layout tab, in the Page Background group, click Page Color.

Click No Color.

Note When no background is specified for a Web page, the page appears in the default background color set in the Web browser of the person who is viewing the page.

Turn on the Office Clipboard

To display the Office Clipboard in the task pane (task pane: A window within an Office application that provides commonly used commands. Its location and small size allow you to use these commands while still working on your files.), do the following in these Office programs:

Access, Excel, Outlook, PowerPoint, or Word

On the Home tab (Message tab in Outlook), in the Clipboard group, click the Clipboard Dialog Box Launcher.

Publisher or SharePoint Designer

On the Edit menu, click Office Clipboard.

Turn off the Office Clipboard

Do any of the following:

In the Clipboard task pane, click the Close button.

In the Clipboard task pane, click the arrow, and then on the menu, click Close.

Press F6 to give the Clipboard task pane the focus. Press CTRL+SPACEBAR, and then, using the DOWN ARROW key, scroll to Close and press ENTER.

Decorate documents or pictures with borders

Hide All

About borders in Office Word 2007

You can add a border to any or all sides of each page in a document, to pages in a section, to the first page only, or to all pages except the first. You can add page borders in many line styles and colors, as well as a variety of graphical borders.

You can set apart text from the rest of a document by adding borders.

You can add borders to a table or individual table cell.

You can add borders to drawing objects and pictures. You can change or format the border of an object in the same way that you change or format a line.

Add a border to a page

1. On the Page Layout tab, in the Page Background group, click Page Borders.

Make sure you are on the Page Border tab in the Borders and Shading dialog box.

Click one of the border options under Settings.

To specify that the border appears on a particular side of a page, such as only at the top, click Custom under Setting. Under Preview, click where you want the border to appear.

Select the style, color, and width of the border.

To specify an artistic border, such as trees, select an option in the Art box.

Do any of the following:

To specify a particular page or section for the border to appear in, click the option that you want under Apply to.

To specify the exact position of the border on the page, click Options, and then select the options that you want.

Add a border to a drawing object

Note To add a border to a drawing object, you must place the drawing object in a drawing canvas.

On the Insert tab, in the Illustrations group, click Shapes, and then click New Drawing Canvas.

Office Word 2007 adds a drawing canvas.

Right-click the drawing canvas, and then click Format Drawing Canvas on the shortcut menu.

On the Colors and Lines tab, under Line, choose a color, line style, and line weight.

Add any drawing objects that you want to the drawing canvas.

Change a page border

On the Page Layout tab, in the Page Background group, click Page Borders.

Make sure you are on the Page Border tab in the Borders and Shading dialog box.

Change any options that you want.

Change a page border

On the Page Layout tab, in the Page Background group, click Page Borders.

Make sure you are on the Page Border tab in the Borders and Shading dialog box.

Change any options that you want.

Change a border for a drawing object

Right-click the drawing canvas with the border that you want to change, and then click Format Drawing Canvas on the shortcut menu.

On the Colors and Lines tab, under Line, change the color, line style, and line weight.

Remove a border

Remove a border from a page

On the Page Layout tab, in the Page Background group, click Page Borders.

Make sure you are on the Page Border tab in the Borders and Shading dialog box.

Under Setting, click None.

Remove a border from a drawing object

Select whose border you want to remove.

Right-click the drawing canvas and then click Format Drawing Canvas on the shortcut menu.

On the Colors and Lines tab, under Line, click No Color.

Show or hide drawing gridlines

Drawing gridlines are the thin lines that appear on your on-screen document in Print Layout view. Gridlines do not print when you print a document.

Show or hide drawing gridlines

Drawing gridlines appear only in Print Layout view.

On the View tab, in the Show/Hide group, select the Gridlines check box.

You can change the spacing between gridlines and the starting point for gridlines. To temporarily override grid settings, press ALT as you drag or draw an object.

Present data in a chart or graph

Important If Microsoft Office Excel 2007 is installed on your computer, you can take advantage of the advanced charting capabilities in the 2007 Microsoft Office system. If Office Excel 2007 is not installed when you create a new chart in Microsoft Office Word 2007, Microsoft Graph opens. A chart then appears with its associated data in a table called a datasheet. You can enter your own data in the datasheet, import data from a text file to the datasheet, or paste data from another program to the datasheet.

You can also copy a chart from Excel to Office Word 2007. When you copy a chart, it can either be embedded as static data or linked to the workbook. For a chart that is linked to a workbook that you have access to, you can specify that it

automatically check for changes in the linked workbook whenever the chart is opened.

You can add a chart or graph to your document in one of two ways:

You can insert a chart in your document by it. When you embed data from an Excel chart in Word, you edit that data in Office Excel 2007, and the worksheet is saved with the Word document.

You can paste an Excel chart into your presentation and link to data in Office Excel 2007. When you copy a chart from Office Excel 2007 and paste it into your document, the data in the chart is linked to the Excel worksheet. The Excel worksheet is a separate file and is not saved with the Word document. In this case, because the Excel worksheet is not part of the Word document, if you want to change the data in the chart, you must make your changes to the linked worksheet in Office Excel 2007.

Change the chart type of an existing chart

For most 2-D charts, you can change the chart type of the entire chart to give the chart a completely different look, or you can select a different chart type for any single data series (data series: Related data points that are plotted in a chart. Each data series in a chart has a unique color or pattern and is represented in the chart legend. You can plot one or more data series in a chart. Pie charts have only one data series.), which turns the chart into a combination chart. For bubble charts and most 3-D charts, you can only change the chart type of the entire chart. For more information about the chart types that you can use, see Available chart types.

Do one of the following:

To change the chart type of the entire chart, click the chart area (chart area: The entire chart and all its elements.) or plot area (plot area: In a 2-D chart, the area bounded by the axes, including all data series. In a 3-D chart, the area bounded by the axes, including the data series, category names, tick-mark labels, and axis titles.) of the chart to display the chart tools.

- To change the chart type of a single data series, click that data series.

Tip This displays the chart tools, adding the Design, Layout, and Format tabs.

2. On the Design tab, in the Type group, click Change Chart Type.

In the Change Chart Type dialog box, do one of the following:

Click a chart type in the first box, and then click the chart subtype that you want to use in the second box.

If you saved a chart type as a template, click Templates, and then click the chart template that you want to use in the second box.

Change the display of chart axes

Hide All

Charts typically have two axes (axis: A line bordering the chart plot area used as a frame of reference for measurement. The y axis is usually the vertical axis and contains data. The x-axis is usually the horizontal axis and contains categories.) that are used to measure and categorize data: a vertical axis (also known as value axis or y axis), and a horizontal axis (also known as category axis or x axis). 3-D charts have a third axis, the depth axis (also known as series axis or z axis), so that data can be plotted along the depth of a chart. Radar charts do not have horizontal (category) axes, and pie and doughnut charts do not have any axes.

Vertical (value) axis

Horizontal (category) axis

Depth (series) axis

Available chart types

Hide All

Microsoft Office Excel 2007 supports numerous types of charts to help you display data in ways that are meaningful to your audience. When you want to create a chart or change an existing chart, you can choose from a wide range of chart subtypes available for each of the following chart types.

In this article

Column charts

Line charts

Pie charts

Bar charts

Area charts

XY (scatter) charts

Stock charts

Surface charts

Doughnut charts

Bubble charts

Radar charts

Replace a shape

Click the shape that you want to change.

To change multiple shapes, click the first shape, and then press and hold CTRL while you click the additional shapes.

Under SmartArt Tools, on the Format tab, in the Shapes group, click the arrow next to Change Shape, and then click the shape that you want.

Select a chart element by using the mouse

On a chart, click the chart element that you want to select.

The element that you select will be clearly marked with selection handles.

Tip To help you locate the chart element that you want to select, Microsoft Office Excel displays an element name when you rest the pointer over a chart element.

Rotation

The X, Y, and Z axes define the orientation (rotation) and position of the camera (view) that is viewing the shapes. X is the horizontal axis; Y is the vertical axis; and Z is the third dimension of depth. Values for these axes are additive and the camera is first rotated by the X value, then the Y value, and finally the Z value. When you use the "nudge" buttons to change the X, Y, or Z value, the change is always made relative to the camera's current position.

Display or hide chart gridlines

To make the data in a chart easier to read, you can display horizontal and vertical chart gridlines that extend from any horizontal and vertical axes (axis: A line bordering the chart plot area used as a frame of reference for measurement. The y axis is usually the vertical axis and contains data. The x-axis is usually the horizontal axis and contains categories.) across the plot area (plot area: In a 2-D chart, the area bounded by the axes, including all data series. In a 3-D chart, the area bounded by the axes, including the data series, category names, tick-mark labels, and axis titles.) of the chart. You can also display depth gridlines in 3-D charts. Gridlines can be displayed for major and minor units, and they align with major and minor tick marks on the axes when those are displayed.

Click the chart to which you want to add chart gridlines.

This displays the Chart Tools, adding the Design, Layout, and Format tabs.

On the Layout tab, in the Axes group, click Gridlines.

Create a Smart Art graphic

A SmartArt graphic is a visual representation of your information that you can quickly and easily create, choosing from among many different layouts, to effectively communicate your message or ideas.

Overview of the Text pane used with SmartArt graphics

The Text pane is the pane to the left of a SmartArt graphic, where you can enter and edit the text that appears in your SmartArt graphic.

By using the Text pane, you can focus on your message without having to worry about the resulting SmartArt graphic. When you create a SmartArt graphic, the SmartArt graphic and its Text pane are populated with placeholder text that you can edit and replace with your information. At the top of the Text pane, you can edit the text that will appear in your SmartArt graphic. At the bottom of the Text pane, you can view additional information about the SmartArt graphic, such as what type of information it is best suited for. If the information at the bottom of the Text pane is not visible, either point to the SmartArt graphic name at the bottom of the Text pane, or drag a border of the Text pane to make it larger.

Although you cannot drag text onto the Text pane, you can copy and paste within the Text pane. You can also copy from the Text pane to any 2007 Microsoft Office system document, or from 2007 Office release documents to the Text pane. As you complete your content in the Text pane, you can try different layouts and customize your SmartArt graphic.

Resize the Text pane

Point to any edge of the Text pane.

When the pointer changes to a , drag to resize the Text pane.

Move the Text pane

To move the whole Text pane, drag the top

Add or delete arrowheads

Add or delete arrowheads in the following 2007 Microsoft Office system programs: Excel, Outlook, Word, and PowerPoint

Select the line that you want to add arrowheads to.

If you want to add arrowheads to multiple lines, select the first line, and then press and hold CTRL while you select the other lines.

Under Drawing Tools, on the Format tab, in the Shape Styles group, click the arrow next to Shape Outline.

Point to Arrows, and then click the arrow style that you want.

To create a custom arrow style, click More Arrows, and then choose the options that you want. To delete all arrowheads, click Arrow Style 1 (no arrowheads).

Add or delete arrowheads in Microsoft Office Publisher 2007

Select the line that you want to add arrowheads to.

If you want to add arrowheads to multiple lines, select the first line, and then press and hold CTRL while you select the other lines.

On the Formatting toolbar (toolbar: A bar with buttons and options that you use to carry out commands. To display a toolbar, press ALT and then SHIFT+F10.), click Arrow Style , and then click the style that you want.

To create a custom arrow style, click More Arrows, and then choose the options that you want. To delete all arrowheads, click Arrow Style 1 (no arrowheads).

Top of Page

See Also

- Change the color, style, or weight of a line

insert clip art

On the Insert tab, in the Illustrations group, click Clip Art.

In the Clip Art task pane, in the Search for text box, type a word or phrase that describes the clip art that you want, or type in all or some of the file name of the clip art.

To narrow your search, do one or both of the following:

To limit the search results to a specific collection of clip art, in the Search in box, click the arrow and select the collection you want to search.

To limit the search results to clip art, click the arrow in the Results should be box and select the check box next to Clip Art.

In the Clip Art task pane, you can also search for photographs, movies, and sounds. To include any of those media types, select the check boxes next to them.

Click Go.

In the list of results, click the clip art to insert it.

Start with a drawing canvas

When you insert a drawing object in Word, you can place it in a drawing canvas. The drawing canvas helps you arrange a drawing in your document.

The drawing canvas provides a frame-like boundary between your drawing and the rest of your document. By default, the drawing canvas has no border or background, but you can apply formatting to the drawing canvas as you would any drawing object.

The drawing canvas also helps you keep parts of your drawing together, which is especially helpful if your drawing consists of several shapes. The best practice is to insert a drawing canvas if you plan to include more than one shape in your illustration.

For example, if you want to create a flow chart, you start with a drawing canvas and then add the shapes and lines for your chart.

Add a drawing

When you create a drawing in Microsoft Word, you must begin by inserting a drawing canvas. The drawing canvas helps you arrange and resize the objects in your drawing.

Click in your document where you want to create the drawing.

On the Insert tab, in the Illustrations group, click Shapes, and then click New Drawing Canvas.

A drawing canvas is inserted into your document.

When you insert a drawing canvas, you can do any of the following on the Format tab under Drawing Tools:

Click a shape or shapes to insert into your document.

You can also change the shape and add text to it.

Draw on the canvas. To draw, click Shapes, and then click Freeform or Scribble under Lines.

Tip To stop drawing with the Freeform or Scribble lines, double-click.

Adjust the size of the canvas by selecting it and then clicking the arrows in the Size group, or click the Size Dialog Box Launcher to specify more precise measurements.

Apply a style to a shape. In the Shape Styles group, rest your pointer over a style to see what your shape will look like when you apply that style. Click the style to apply it. Or, click Shape Fill or Shape Outline and select the options that you want.

Note If you want to apply a color and gradient that aren't available in the Shape Styles group, select the color first, and then apply the gradient.

Use shadow and three-dimensional (3-D) effects to add interest to the shapes in your drawing.

Align the objects on the canvas. To align the objects, press and hold CTRL while you select the objects that you want to align. In the Arrange group, click Align to choose from an assortment of alignment commands.

Delete all or part of a drawing

Select the drawing canvas or the drawing object that you want to delete.

Press DELETE.

Overview of fills, gradients, and effects

A fill is the interior of a shape. When you change the fill color of a shape, you can also add a texture, picture, or gradient to the fill. A gradient is a gradual progression of colors and shades, usually from one color to another color, or from one shade to another shade of the same color.

Changing the fill color of a shape affects only the inside or front of the shape. If you add another effect, such as a shadow, and want a different color for that effect, you must change the color of the shadow separately.

A 3-D effect adds depth to a shape. You can add a built-in combination of 3-D effects to your shape, or you can add individual effects. You can add combinations of individual effects to your shape in these 2007 Microsoft Office system programs: Excel, Outlook, Word, and PowerPoint.

Add a clip to your document

In Microsoft Clip Organizer, select the clip (clip: A single media file, including art, sound, animation, or movies.) you want to add to your open document.

Drag the clip into your open document.

Add multiple clips

The following procedure only works when the clips (clip: A single media file, including art, sound, animation, or movies.) you want to add are all in the same category.

In Microsoft Clip Organizer, select the clips you want to add to your document by clicking a single clip and then pressing the CTRL key while clicking additional clips.

Drag the clips into your open document.

Note Some programs will only add one clip at a time. If you attempt to insert multiple clips in one of these applications, it will insert only the last selected clip.

Add or delete WordArt

Hide All

WordArt is a gallery of text styles that you can add to your 2007 Microsoft Office system documents to create decorative effects, such as shadowed or mirrored (reflected) text. In Microsoft Office PowerPoint 2007, you can also convert existing text into WordArt.

You can change WordArt text like you can change any other text in a shape.

Add WordArt

For these 2007 Office release programs: Excel and PowerPoint

On the Insert tab, in the Text group, click WordArt, and then click the WordArt style that you want.

Enter your text.

Notes

You can customize the shape surrounding the WordArt as well as the text in the WordArt.

If you have a chart in your 2007 Office release document, you can replace the chart title with WordArt to give the title additional emphasis.

Page Breaks and Section Breaks

Insert a page break

You can insert a page break anywhere in your document, or you can specify where Microsoft Word positions automatic page breaks.

Insert a manual page break

Click where you want to start a new page.

On the Insert tab, in the Pages group, click Page Break.

Insert a section break

You can use section breaks to change the layout or formatting of a page or pages in your document. For example, you can lay out part of a single-column page as two columns. You can separate the chapters in your document so that the page numbering for each chapter begins at 1. You can also create a different header or footer for a section of your document.

Note In Microsoft Office Word 2007, you can choose many page layouts from the gallery of new page designs. For example, you can add a single-column page that has a two-column section by clicking that page layout option in the gallery of New Page designs.

Section formatted as a single column

Section formatted as two columns

The following examples show the types of section

The Next Page command inserts a section break and starts the new section on the next page. This type of section break is especially useful for starting new chapters in a document.

The Continuous command inserts a section break and starts the new section on the same page. A continuous section break is useful for creating a formatting change, such as a different number of columns, on a page.

The Even Page or Odd Page command inserts a section break and starts the new section on the next even-numbered or odd-numbered page. If you want document chapters always to begin on an odd page or on an even page, use the Odd page or Even page section break option.

Change the document layout or formatting

Click where you want to make a formatting change.

You might want to select a portion of the document around which to insert a pair of section breaks.

On the Page Layout tab, in the Page Setup group, click Breaks.

In the Section Breaks group, click the section break type that fits the type of formatting change that you want to make.

For example, if you're separating a document into chapters, you might want each chapter to start on an odd page. Click Odd Page in the Section Breaks group.

Remove changes of the document layout

A section break defines where a formatting change occurs in the document. When you delete a section break, you also delete the section formatting for the text before the break. That text becomes part of the following section, and it assumes the formatting of that section.

Make sure that you're in Draft view so that you can see the double dotted line section break.

Select the section break

Tables of Contents and other Reference

You create a table of contents by choosing the heading styles — for example, Heading 1, Heading 2, and Heading 3 — that you want to include in the table of contents. Microsoft Office Word searches for headings that match the style that you chose, formats and indents the entry text according to the heading style, and then inserts the table of contents into the document.

Microsoft Office Word 2007 provides a gallery with multiple table of contents styles to choose from. Mark the table of contents entries, and then click the table of contents style that you want from the gallery of options. Office Word 2007 automatically creates the table of contents from the headings that you marked.

Mark entries for a table of contents

The easiest way to create a table of contents is to use the built-in heading styles (heading style: Formatting applied to a heading. Microsoft Word has nine different built-in styles: Heading 1 through Heading 9.). You can also create a table of contents that is based on the custom styles that you have applied. Or you can assign the table of contents levels to individual text entries.

Mark entries by using built-in heading styles

Select the heading to which you want to apply a heading style.

On the Home tab, in the Styles group, click the style that you want.

For example, if you selected text that you want to style as a main heading, click the style called Heading 1 in the Quick Style gallery.

Create a table of contents

After you mark the entries for your table of contents, you are ready to build it.

Create a table of contents from built-in heading styles

Use this procedure if you created a document by using heading styles.

Click where you want to insert the table of contents, usually at the beginning of a document.

On the References tab, in the Table of Contents group, click Table of Contents, and then click the table of contents style that you want.

Update the table of contents

If you added or removed headings or other table of contents entries in your document, you can quickly update the table of contents.

On the References tab, in the Table of Contents group, click Update Table.

Click Update page numbers only or Update entire table.

Delete a table of contents

On the References tab, in the Table of Contents group, click Table of Contents.

Click Remove Table of Contents

Insert or delete a footnote or an endnote

Footnotes and endnotes are used in printed documents to explain, comment on, or provide references for text in a document. You might use footnotes for detailed comments and endnotes for citation of sources.

Note If you want to create a bibliography, you can find commands for creating and managing sources and citations on the References tab in the Citations & Bibliography group.

About footnotes and endnotes

A footnote or an endnote consists of two linked parts – the note reference mark (note reference mark: A number, character, or combination of characters that indicates that additional information is contained in a footnote or endnote.) and the corresponding note text.

Footnote and endnote reference marks

Separator line

Footnote text

Endnote text

Insert a footnote or an endnote

Microsoft Office Word automatically numbers footnotes and endnotes for you, after you specify a numbering scheme. You can use a single numbering scheme throughout a document, or you can use different numbering schemes within each section (section: A portion of a document in which you set certain page formatting options. You create a new section when you want to change such properties as line numbering, number of columns, or headers and footers.) in a document.

When you add, delete, or move notes that are automatically numbered, Word rennumbers the footnote and endnote reference marks.

Note If the footnotes in your document are numbered incorrectly, your document may contain tracked changes. Accept the tracked changes so that Word will correctly number the footnotes and endnotes.

In Print Layout view (Print Layout view: A view of a document or other object as it will appear when you print it. For example, items such as headers, footnotes, columns, and text boxes appear in their actual positions.), click where you want to insert the note reference mark.

On the References tab, in the Footnotes group, click Insert Footnote or Insert Endnote.

Keyboard shortcut To insert a subsequent footnote, press CTRL+ALT+F. To insert a subsequent endnote, press CTRL+ALT+D.

By default, Word places footnotes at the end of each page and endnotes at the end of the document.

To make changes to the format of footnotes or endnotes, click the Footnotes Dialog Box Launcher, and do one of the following:

In the Number format box, click the format that you want.

To use a custom mark instead of a traditional number format, click Symbol next to Custom mark, and then choose a mark from the available symbols.

Click Insert.

Note This will not change the existing symbols. It will only add new ones.

Word inserts the note number and places the insertion point next to the note number.

Type the note text.

Double-click the footnote or endnote number to return to the reference mark in the document

Convert one or more notes to footnotes or endnotes

Be sure you are in Draft view (click Draft on the status bar).

On the References tab, in the Footnotes group, click Show Notes.

If your document contains both footnotes and endnotes, a message appears. Click View footnote area or View endnote area, depending on whether you want to convert footnotes or endnotes, and then click OK.

Select the number of the note or notes that you want to convert, and then right-click.

Click Convert to Footnote or Convert to Endnote.

Convert all notes to footnotes or endnotes

On the References tab, click the Footnote & Endnote Dialog Box Launcher.

Click Convert.

Add or delete bookmarks

A bookmark identifies a location or a selection of text that you name and identify for future reference. For example, you might use a bookmark to identify text that you want to revise at a later time. Instead of scrolling through the document to locate the text, you can go to it by using the Bookmark dialog box.

You can also add cross-references to bookmarks. For example, after you insert a bookmark in a document, you can refer to that bookmark from other places in the text by creating cross-references to the bookmark.

Add a bookmark

Select the text or item to which you want to assign a bookmark, or click where you want to insert a bookmark.

On the Insert tab, in the Links group, click Bookmark.

Under Bookmark name, type or select a name.

Bookmark names must begin with a letter and can contain numbers. You can't include spaces in a bookmark name. However, you can use the underscore character to separate words — for example, "First_heading."

Click Add.

Display bookmark brackets

Click the Microsoft Office Button , and then click Word Options.

Click Advanced, and then select the Show bookmarks check box under Show document content.

Click OK.

If you assign a bookmark to an item, the bookmark appears in brackets ([...]) on the screen. If you assign a bookmark to a location, the bookmark appears as an I-beam. The brackets are not printed.

Delete a bookmark

On the Insert tab, in the Links group, click Bookmark.

Click the name of the bookmark you want to delete, and then click Delete.

Create a bibliography

A bibliography is a list of sources, usually placed at the end of a document, that you consulted or cited in creating the document. In Microsoft Office Word 2007, you can automatically generate a bibliography based on the source information that you provide for the document.

Each time that you create a new source, the source information is saved on your computer, so that you can find and use any source you have created.

Add a new citation and source to a document

When you add a new citation to a document, you also create a new source that will appear in the bibliography.

On the References tab, in the Citations & Bibliography group, click the arrow next to Style.

Click the style that you want to use for the citation and source.

For example, social sciences documents usually use the MLA or APA styles for citations and sources.

Click at the end of the sentence or phrase that you want to cite.

On the References tab, in the Citations & Bibliography group, click Insert Citation.

Do one of the following:

To add the source information, click Add New Source.

To add a placeholder, so that you can create a citation and fill in the source information later, click Add new placeholder. A question mark appears next to placeholder sources in Source Manager.

Begin to fill in the source information by clicking the arrow next to Type of source.

For example, your source might be a book, a report, or a Web site.

Fill in the bibliography information for the source.

To add more information about a source, click the Show All Bibliography

Create an index

An index lists the terms and topics that are discussed in a document, along with the pages that they appear on. To create an index, you mark the index entries by providing the name of the main entry and the cross-reference in your document, and then you build the index.

About index entries

You can create an index entry:

For an individual word, phrase, or symbol

For a topic that spans a range of pages

That refers to another entry, such as "Transportation. See Bicycles"

When you select text and mark it as an index entry, Microsoft Office Word adds a special XE (Index Entry) field that includes the marked main entry and any cross-reference information that you choose to include.

After you mark all the index entries, you choose an index design and build the finished index. Word collects the index entries, sorts them alphabetically, references their page numbers, finds and removes duplicate entries from the same page, and displays the index in the document.

Mark index entries and create an index

To create an index, you mark the entries, select a design, and then build the index.

Step 1: Mark index entries

To mark index entries, do one of the following:

Mark words or phrases

To use existing text as an index entry, select the text. To enter your own text as an index entry, click where you want to insert the index entry.

On the References tab, in the Index group, click Mark Entry.

To create the main index entry that uses your own text, type or edit the text in the Main entry box.

If you want, you can customize the entry by creating a subentry, a third-level entry, or a cross-reference to another entry:

To create a subentry, type the text in the Subentry box.

To include a third-level entry, type the subentry text followed by a colon (:), and then type the text of the third-level entry.

To create a cross-reference to another entry, click Cross-reference under Options, and then type the text for the other entry in the box.

To format the page numbers that will appear in the index, select the Bold check box or the Italic check box below Page number format.

To format the text for the index, select the text in the Main entry or Subentry box, right-click, and then click Font. Select the formatting options that you want to use.

To mark the index entry, click Mark. To mark all occurrences of this text in the document, click Mark All.

To mark additional index entries, select the text, click in the Mark Index Entry dialog box, and then repeat step 3 through step 6.

Mark entries for text that spans a range of pages

Select the range of text that you want the index entry to refer to.

On the Insert tab, in the Links group, click Bookmark.

In the Bookmark name box, type a name, and then click Add.

In the document, click at the end of the text that you marked with a bookmark.

On the References tab, in the Index group, click Mark Entry.

In the Main entry box, type the index entry for the marked text.

To format the page numbers that will appear in the index, select the Bold check box or the Italic check box below Page number format.

To format the text for the index, select the text in the Main entry or Subentry box, right-click, and then click Font. Select the formatting options that you want to use.

Under Options, click Page range.

In the Bookmark box, type or select the bookmark name that you typed in step 3, and then click Mark.

Step 2: Create the index

After you mark the entries, you are ready to select an index design and insert the index into your document.

Click where you want to add the index.

On the References tab, in the Index group, click Create Index, and then click Insert Index.

Do one of the following:

Click a design in the Formats box to use one of the available index designs.

Design a custom index layout:

In the Formats box, click From template, and then click Modify.

In the Style dialog box, click the index style that you want to change, and then click Modify.

Under Formatting, select the options that you want.

To add the style changes to your template, click All documents based on the template.

Click OK twice.

Delete an index entry

Select the entire index entry field, including the braces ({}), and then press DELETE.

If you don't see the XE fields, click Show/Hide in the Paragraph group on the Home tab. To update the index, click the index, and then press F9. Or click Update Index in the Index group on the References tab.

Mail Merge

Use mail merge to create and print letters and other documents

You use mail merge when you want to create a set of documents, such as a form letter that is sent to many customers or a sheet of address labels. Each letter or label has the same kind of information, yet the content is unique. For example, in letters to your customers, each letter can be personalized to address each customer by name. The unique information in each letter or label comes from entries in a data source.

The mail merge process entails the following overall steps:

1. Set up the main document. The main document contains the text and graphics that are the same for each version of the merged document. For example, the return address or salutation in a form letter.
2. Connect the document to a data source. A data source is a file that contains the information to be merged into a document. For example, the names and addresses of the recipients of a letter.
3. Refine the list of recipients or items. Microsoft Office Word generates a copy of the main document for each item, or record, in your data file. If your data file is a mailing list, these items are probably recipients of your mailing. If you want to generate copies for only certain items in your data file, you can choose which items (records) to include.
4. Add placeholders, called mail merge fields, to the document. When you perform the mail merge, the mail merge fields are filled with information from your data file.
5. Preview and complete the merge. You can preview each copy of the document before you print the whole set.

Tip You can also perform a mail merge by using the Mail Merge task pane, which leads you step by step through the process. To use the task pane, in the Start Mail Merge group on the Mailings tab, click Start Mail Merge, and then click Step by Step Mail Merge Wizard.

Set up the main document

1. Start Word.

A blank document opens by default. Leave it open. If you close it, the commands in the next step are not available.

2. On the Mailings tab, in the Start Mail Merge group, click Start Mail Merge.

A blue rectangular button with the text "Start Mail Merge" in white.

3. Click the type of document that you want to create.

For example, you can create:

- ↓ A set of envelopes The return address is the same on all the envelopes, but the destination address is unique on each one. Click Envelopes, and then specify your preferences for envelope size and text formatting on the Envelope Options tab of the Envelope Options dialog box.
- ↓ A set of address labels Each label shows a person's name and address, but the name and address on each label is unique. Click Labels, and then specify your preferences for the type of label in the Label Options dialog box.
- ↓ A set of form letters or e-mail messages The basic content is the same in all the letters or messages, but each contains information that is specific to the individual recipient, such as name, address, or some other piece of information. Click Letters or E-mail messages to create these types of documents.
- ↓ A catalog or directory The same kind of information, such as name and description, is shown for each item, but the name and description in each item is unique. Click Directory to create this type of document.

Connect the document to a data source

To merge information into your main document, you must connect the document to a data source, or a data file. If you don't already have a data file, you can create one during the mail merge process.

Choose a data file

1. On the Mailings tab, in the Start Mail Merge group, click Select Recipients.
2. Do one of the following:

Refine the list of recipients or items

When you connect to a certain data file, you might not want to merge information from all the records in that data file into your main document.

To narrow the list of recipients or use a subset of the items in your data file, do the following:

1. On the Mailings tab, in the Start Mail Merge group, click Edit Recipient List.
2. In the Mail Merge Recipients dialog box, do any of the following:

To filter records, do the following:

1. Under Refine recipient list, click Filter.
2. On the Filter Records tab of the Filter and Sort dialog box, choose the criteria you want to use for the filter.

For example, to generate copies of your main document only for addresses that list Australia as the country/region, you would click Country or Region in the Field list, Equal to in the Comparison list, and Australia in the Compare to list.

3. To refine the filter further, click And or Or, and then specify more criteria.

For example, to generate copies of your main document only for businesses in Munich, you would filter on records whose City field contains Munich and whose Company Name field is not blank. If you use Or instead of And in this filter, your mail merge includes all Munich addresses as well as all addresses that include a company name, regardless of city.

Add placeholders, called mail merge fields, to the document

After you connect your main document to a data file, you are ready to type the text of the document and add placeholders that indicate where the unique information will appear in each copy of the document.

The placeholders, such as address and greeting, are called mail merge fields. Fields in Word correspond to the column headings in the data file that you select.

1 Columns in a data file represent categories of information. Fields that you add to the main document are placeholders for these categories.

2 Rows in a data file represent records of information. Word generates a copy of the main document for each record when you perform a mail merge.

By putting a field in your main document, you indicate that you want a certain category of information, such as name or address, to appear in that location.

Note When you insert a mail merge field into the main document, the field name is always surrounded by chevrons (« »). These chevrons do not show up in the merged documents. They just help you distinguish the fields in the main document from the regular text.

What happens when you merge

When you merge, information from the first row in the data file replaces the fields in your main document to create the first merged document. Information from the second row in the data file replaces the fields to create the second merged document, and so on.

Working with fields: Examples

You can add any column heading from your data file to the main document as a field. This gives you flexibility when you design form letters, labels, e-mail messages, and other merged documents. For example:

- ↓ Suppose you are creating a letter to notify local businesses that they have been selected for inclusion in your annual city guide. If your data file contains a Company column with the name of each business that you want to contact, you can insert the «Company» field instead of typing the name of each individual company.
- ↓ Imagine that you send quarterly e-mail messages to your customers alerting them to new products and special deals. To personalize those messages for your best customers, you can add a PersonalNote column to your data file where you can type notes such as "Miss Miller, the new widget is exactly what you have been looking for." By placing a «PersonalNote» field in the main document, you can include those notes at the bottom of certain messages.

- ↓ Suppose that your mailing list is for subscribers to your newsletter, and your data file includes a column, called `ExpireDate`, for storing the date that each subscription expires. If you place an `«ExpireDate»` field in the label main document before you run the merge, subscribers will each see their own expiration date on their mailing label.

You can combine fields and separate them by punctuation marks. For example, to create an address, you can set up the fields in your main document like this:

`«First Name» «Last Name»`

`«Street Address»`

`«City», «State» «Postal code»`

For things that you use frequently, like address blocks and greeting lines, Word provides composite fields that group a number of fields together. For example:

- ↓ The Address Block field is a combination of several fields, including first name, last name, street address, city, and postal code.
- ↓ The Greeting Line field can include one or more name fields, depending on your chosen salutation.

You can customize the content in each of these composite fields. For example, in the address, you may want to select a formal name format (Mr. Joshua Randall Jr.); in the greeting, you may want to use "To" instead of "Dear."

Map mail merge fields to your data file

To make sure that Word can find a column in your data file that corresponds to every address or greeting element, you may need to map the mail merge fields in Word to the columns in your data file.

To map the fields, click **Match Fields** in the **Write & Insert Fields** group of the **Mailings** tab.

The Match Fields dialog box opens.

Type content and add fields

1. In the main document, click where you want to insert the field.
2. Use the **Write & Insert Fields** group on the **Mailings** tab.
 1. After you add all of your custom fields to the view, close the Field Chooser dialog box.
 2. To remove a field that you do not want included in the mail merge, click the field name in the column heading in Phone List view, and drag it off of the column heading.

Preview and complete the merge

After you add fields to your main document, you are ready to preview the merge results. When you are satisfied with the preview, you can complete the merge.

Preview the merge

You can preview your merged documents and make changes before you actually complete the merge.

To preview, do any of the following in the Preview Results group of the Mailings tab:

Click Preview Results.

Page through each merged document by using the Next Record and Previous Record buttons in the Preview Results group.

Preview a specific document by clicking Find Recipient.

Note Click Edit Recipient List in the Start Mail Merge group on the Mailings tab to open the Mail Merge Recipients dialog box, where you can filter the list or clear recipients if you see records that you don't want to include.

Complete the merge

You can print the merged documents or modify them individually. You can print or change all or just a subset of the documents.

Print the merged documents

1. On the Mailings tab, in the Finish group, click Finish & Merge, and then click Print Documents.
2. Choose whether to print the whole set of documents, only the copy that's currently visible, or a subset of the set, which you specify by record number.

Change individual copies of the document

1. On the Mailings tab, in the Finish group, click Finish & Merge, and then click Edit Individual Documents.
2. Choose whether you want to edit the whole set of documents, only the copy that's currently visible, or a subset of the set, which you specify by record number. Word saves the copies that you want to edit to a single file, with a page break between each copy of the document.

Work Book Management

Managing Work Book

Create a new workbook

A Microsoft Office Excel workbook is a file that contains one or more worksheets (worksheet: The primary document that you use in Excel to store and work with data. Also called a spreadsheet. A worksheet consists of cells that are organized into columns and rows; a worksheet is always stored in a workbook.) That you can use to organize various kinds of related information. To create a new workbook, you can open a blank workbook. You can also base a new workbook on an existing workbook..

Open a new, blank workbook

- Click Microsoft Office Button , and then click New.

Keyboard shortcut You can also press CTRL+N.

- Under Templates, make sure that Blank and recent is selected, and then under Blank and recent in the right pane, click Blank Workbook.

Base a new workbook on an existing workbook

1. Click Microsoft Office Button , and then click New.

Keyboard shortcut You can also press CTRL+N.

2. Under Templates, click New from existing.
3. In the New from Existing Workbook dialog box, browse to the drive, folder
4. Click the workbook, and then click Create New.

Base a new workbook on a template

1. Click Microsoft Office Button , and then click New.

Keyboard shortcut You can also press CTRL+N.

2. Under Templates, click Installed Templates or My templates.
3. Do one of the following:
 1. To use an installed template, under Installed Templates, click the template that you want, and then click Create.
 2. To use your own template, on the My Templates tab, double-click the template that you want.

Entering and Editing Data

Enter data manually in worksheet cells

You can enter numbers (with or without fixed decimal points), text, dates, or times in one cell, in several cells at once, or on more than one worksheet (worksheet: The primary document that you use in Excel to store and work with data. Also called a spreadsheet. A worksheet consists of cells that are organized into columns and rows; a worksheet is always stored in a workbook.).

Enter numbers or text

- On the worksheet, click a cell.
- Type the numbers or text that you want, and then press ENTER or TAB.

Enter numbers with a fixed decimal point

1. Click the Microsoft Office Button , and then click Excel Options.
2. Click Advanced, and then under Editing options, select the Automatically insert a decimal point check box.
3. In the Places box, enter a positive number for digits to the right of the decimal point or a negative number for digits to the left of the decimal point.

Enter dates or times

1. On the worksheet, click a cell.
2. Type a date or time as follows:
 - For a date, use a slash mark or a hyphen to separate the parts of a date; for example, type 9/5/2002 or 5-Sep-2002.

Tip To enter the current date, press CTRL+; (semicolon).

- For a time that is based on the 12-hour clock, type a space, and then type a or p after the time; for example, 9:00 p. Otherwise, Excel enters the time as AM.

Tip To enter the current time, press CTRL+SHIFT+; (semicolon).

How to select cells, ranges, rows, or columns

To select	Do this
A single cell	Click the cell, or press the arrow keys to move to the cell.
A range of cells	Click the first cell in the range, and then drag to the last cell, or hold down SHIFT while you press the arrow keys to extend the selection.
	You can also select the first cell in the range, and then press F8 to extend the selection by using the arrow keys. To stop extending the

selection, press F8 again.

A large range of cells

Click the first cell in the range, and then hold down SHIFT while you click the last cell in the range. You can scroll to make the last cell visible.

All cells on a worksheet

Click the Select All button.

To select the entire worksheet, you can also press CTRL+A.

Note If the worksheet contains data, CTRL+A selects the current region. Pressing CTRL+A a second time selects the entire worksheet.

Enter the same data on other worksheets

If you already entered data on one worksheet, you can quickly fill this data into corresponding cells on other worksheets.

- Click the tab of the worksheet that contains the data. Then hold down CTRL while you click the tabs of the worksheets into which you want to fill the data.

- In the worksheet, select the cells that contain the data that you entered.
- On the Home tab, in the Editing group, click Fill, and then click Across Worksheets.

- Under Fill, select the option that you want.
 - ☒ How to view worksheets at the same time
- On the View tab, in the Window group, click New Window.

- Switch to the new window, and then click the sheet tab of the worksheet that you want to view.

Repeat steps 1 and 2 for each worksheet that you want to view.

- On the View tab, in the Window group, click Arrange All.
2. To cancel a selection of multiple worksheets, click any unselected worksheet. If an unselected worksheet is not visible, right-click the sheet tab of a selected worksheet, and then click

Insert a symbol, fraction, or special character

1. Click where you want to insert the symbol.
2. On the Insert tab, in the Text group, click Symbol.
3. In the Symbol dialog box, click the Symbols tab, and then do one of the following:
 1. Click the symbol that you want to insert.
4. Click Insert.

Find a Unicode character code

When you select a Unicode character in the Symbol dialog box, its character code appears in the Character code box.

1. On the Insert tab, in the Text group, click Symbol.
2. On the Symbols tab, in the Font box, click the font that you want.
3. In the from box, click Unicode (hex).
4. The Unicode character code is displayed in the Character code box

Fill data automatically in worksheet cells

For fast data entry, you can have Microsoft Office Excel automatically repeat data or you can fill data automatically.

Automatically repeat items already entered in the column

If the first few characters that you type in a cell match an existing entry in that column, Excel automatically enters the remaining characters for you. Excel automatically completes only

those entries that contain text or a combination of text and numbers. Entries that contain only numbers, dates, or times are not automatically completed.

Do one of the following:

1. To accept a proposed entry, press ENTER.

The completed entry exactly matches the pattern of uppercase and lowercase letters of the existing entry.

2. To replace the automatically entered characters, continue typing.
3. To delete the automatically entered characters, press BACKSPACE.

Use the fill handle to fill data

You can use the Fill command to fill data into worksheet cells. You can also have Excel automatically continue a series of numbers, number and text combinations, dates, or time periods, based on a pattern that you establish. However, to quickly fill in several types of data series,

Click the Microsoft Office Button , and then click Excel Options.

1. Click Advanced, and then under Editing options, clear or select the Enable Fill handle and cell drag-and-drop check box to hide or display the fill handle.
2. To avoid replacing existing data when you drag the fill handle, make sure that the Alert before overwriting cells check box is selected. If you

don't want to receive a message about overwriting nonblank cells, you can clear this check box.

If you don't want to display the Auto Fill Options button every time you drag the fill handle, you can turn it off.

1. Click the Microsoft Office Button , and then click Excel Options.
2. Click Advanced, and then under Cut, Copy, and Paste, clear the Show Paste Options buttons check box.

Fill data into adjacent cells

You can use the Fill command to fill the active cell or a selected range with the contents of an adjacent cell or range, or you can quickly fill adjacent cells by dragging the fill handle (fill handle: The small black square in the lower-right corner of the selection. When you point to the fill handle, the pointer changes to a black cross.) .

Fill the active cell with the contents of an adjacent cell

1. Select an empty cell below, to the right, above, or to the left of the cell that contains the data that you want to fill in that cell.

2. On the Home tab, in the Editing group, click Fill, and then click Down, Right, Up, or Left.

Tip To quickly fill a cell with the contents of the cell above or to the left of it, you can press CTRL+D or CTRL+R.

Drag the fill handle to fill data into adjacent cells

Select the cells that contain the data that you want to fill into adjacent cells.

Drag the fill handle across the cells that you want to fill.

Fill in a series of numbers, dates, or other built-in series items

Using the fill handle (fill handle: The small black square in the lower-right corner of the selection. When you point to the fill handle, the pointer changes to a black cross.), you can quickly fill cells in a range with a series of numbers or dates or with a built-in series for days, weekdays, months, or years.

Select the first cell in the range that you want to fill.

Type the starting value for the series.

Type a value in the next cell to establish a pattern.

For example, if you want the series 1, 2, 3, 4, 5..., type 1 and 2 in the first two cells. If you want the series 2, 4, 6, 8..., type 2 and 4. If you want the series 2, 2, 2, 2..., you can leave the second cell blank.

Select the cell or cells that contain the starting values.

Drag the fill handle  across the range that you want to fill.

To fill in increasing order, drag down or to the right. To fill in decreasing order, drag up or to the left.

1. On the Home tab, in the Editing group, click Fill, and then click Series.

2. Under Type, click one of the following options:

1. Click Linear for a series that is calculated by adding the value in the Step value box to each cell value in turn.
2. Click Growth for a series that is calculated by multiplying the value in the Step value box by each cell value in turn.

Click Date for a series that fills date values incrementally by the value in the Step value box and dependent on the unit specified under Date unit.

3. Click AutoFill for a series that produces the same results as dragging the fill handle.

Use a custom fill series based on an existing list of items

On the worksheet, select the list of items that you want to use in the fill series.

Click the Microsoft Office Button , and then click Excel Options.

Click Popular, and then under Top options for working with Excel, click Edit Custom Lists.

Verify that the cell reference of the list of items that you selected is displayed in the Import list from cells box, and then click Import.

The items in the list that you selected are added to the Custom lists box.

Click OK twice.

On the worksheet, click a cell, and then type the item in the custom fill series that you want to use to start the list.

Drag the fill handle (fill handle: The small black square in the lower-right corner of the selection. When you point to the fill handle, the pointer changes to a black cross.)

 across the cells that you want to fill.

Edit or delete a custom fill series

Click the Microsoft Office Button , and then click Excel Options.

Click Popular category, and then under Top options for working with Excel, click Edit Custom Lists.

In the Custom lists box, select the list that you want to edit or delete, and then do one of the following:

To edit the fill series, make the changes that you want in the List entries box, and then click Add.

0. To delete the fill series, click Delete.

Insert or delete cells, rows, and columns

You can insert blank cells above or to the left of the active cell (active cell: The selected cell in which data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.) on a worksheet (worksheet: The primary document that you use in Excel to store and work with data. Also called a spreadsheet. A worksheet consists of cells that are organized into columns and rows; a worksheet is always stored in a workbook.),

shifting other cells in the same column down or in the same row to the right. Similarly, you can insert rows above a row and columns to the left of a column. You can also delete cells, rows, and columns.

Note Microsoft Office Excel 2007 has more rows and columns than ever before with the following new limits: 18,278 (A to ZZZ) columns wide by 1,048,576 rows tall.

Insert blank cells on a worksheet

1. Select the cell or the range (range: Two or more cells on a sheet. The cells in a range can be adjacent or nonadjacent.) of cells where you want to insert the new blank cells. Select the same number of cells as you want to insert. For example, to insert five blank cells, you need to select five cells.

Tip To cancel a selection of cells, click any cell on the worksheet.

2. On the Home tab, in the Cells group, click the arrow next to Insert, and then click Insert Cells.

Tip You can also right-click the selected cells and then click Insert on the shortcut menu.

3. In the Insert dialog box, click the direction in which you want to shift the surrounding cells.

Insert rows on a worksheet

Do one of the following:

- To insert a single row, select the row or a cell in the row above which you want to insert the new row. For example, to insert a new row above row 5, click a cell in row 5.
- To insert multiple rows, select the rows above which you want to insert rows. Select the same number of rows as you want to insert. For example, to insert three new rows, you need to select three rows.
- To insert nonadjacent rows, hold down CTRL while you select nonadjacent rows.

Tip To cancel a selection of cells, click any cell on the worksheet.

On the Home tab, in the Cells group, click the arrow next to Insert, and then click Insert Sheet Rows.

Tip You can also right-click the selected rows and then click Insert on the shortcut menu.

Insert columns on a worksheet

Do one of the following:

0. To insert a single column, select the column or a cell in the column immediately to the right of where you want to insert the new column. For example, to insert a new column to the left of column B, click a cell in column B.
1. To insert multiple columns, select the columns immediately to the right of where you want to insert columns. Select the same number of columns as you want to insert. For example, to insert three new columns, you need to select three columns.
2. To insert nonadjacent columns, hold down CTRL while you select nonadjacent columns.

Tip To cancel a selection of cells, click any cell on the worksheet.

On the Home tab, in the Cells group, click the arrow next to Insert, and then click Insert Sheet Columns.

Tip You can also right-click the selected cells and then click Insert on the shortcut menu.

Delete cells, rows, or columns

1. Select the cells, rows, or columns that you want to delete.

Tip To cancel a selection of cells, click any cell on the worksheet.

2. On the Home tab, in the Cells group, do one of the following:

1. To delete selected cells, click the arrow next to Delete, and then click Delete Cells.
2. To delete selected rows, click the arrow next to Delete, and then click Delete Sheet Rows.
3. To delete selected columns, click the arrow next to Delete, and then click Delete Sheet Columns.

Tip You can also right-click a selection of cells, rows, or columns, click Delete on the shortcut menu, and then click the option that you want.

3. If you are deleting a cell or a range (range: Two or more cells on a sheet. The cells in a range can be adjacent or nonadjacent.) of cells, in
4. the Delete dialog box, click Shift cells left, Shift cells up, Entire row, or Entire column.

If you are deleting rows or columns, other rows or columns automatically shift up or to the left.

Wrap text in a cell

If you want text to appear on multiple lines in a cell, you can format the cell so that the text wraps automatically, or you can enter a manual line break.

Wrap text automatically

- In a worksheet, select the cells that you want to format.
- On the Home tab, in the Alignment group, click Wrap Text .

- Select the cell or range for which you want to adjust the row height.
- On the Home tab, in the Cells group, click Format.

- Under Cell Size , do one of the following:
 1. To automatically adjust the row height, click AutoFit Row Height.
 2. To specify a row height, click Row Height, and then type the row height that you want in the Row height box.

Change the column width and row height

On a worksheet, you can specify a column width of 0 (zero) to 255. This value represents the number of characters that can be displayed in a cell that is formatted with the standard font (standard font: The default text font for worksheets. The standard font determines the default font for the Normal cell style.). The default column width is 8.43 characters. If the column width is set to 0, the column is hidden.

Set a column to a specific width

- Select the column or columns that you want to change.
- On the Home tab, in the Cells group, click Format.

- Under Cell Size, click Column Width.
- In the Column width box, type the value that you want.

Change the column width to fit the contents

1. Select the column or columns that you want to change.
2. On the Home tab, in the Cells group, click Format.

3. Under Cell Size, click AutoFit Column Width.

Match the column width to another column

1. Select a cell in the column.
2. On the Home tab, in the Clipboard group, click Copy, and then select the target column.

3. On the Home tab, in the Clipboard group, click the arrow below Paste, and then click Paste Special.
4. Under Paste, select Column widths.

Change the default width for all columns on a worksheet or workbook

The value for the default column width indicates the average number of characters of the standard font that fit in a cell. You can specify a different number for the default column width for a worksheet or workbook.

1. Do one of the following:
 1. To change the default column width for a worksheet, click its sheet tab.
 2. To change the default column width for the entire workbook, right-click a sheet tab, and then click Select All Sheets on the shortcut menu (shortcut menu: A menu that shows a list of commands relevant to a particular item. To display a shortcut menu, right-click an item or press SHIFT+F10.).

2. On the Home tab, in the Cells group, click Format.

3. Under Cell Size, click Default Width.
4. In the Default column width box, type a new measurement.

Change the width of columns by using the mouse

Do one of the following:

1. To change the width of one column, drag the boundary on the right side of the column heading until the column is the width that you want.

2. To change the width of multiple columns, select the columns that you want to change, and then drag a boundary to the right of a selected column heading.
3. To change the width of columns to fit the contents, select the column or columns that you want to change, and then double-click the boundary to the right of a selected column heading.
4. To change the width of all columns on the worksheet, click the Select All button, and then drag the boundary of any column heading.

Set a row to a specific height

1. Select the row or rows that you want to change.
2. On the Home tab, in the Cells group, click Format.

3. Under Cell Size, click Row Height.
4. In the Row height box, type the value that you want.

Change the row height to fit the contents

Select the row or rows that you want to change.

On the Home tab, in the Cells group, click Format.

Under Cell Size, click AutoFit Row Height.

Tip To quickly autofit all rows on the worksheet, click the Select All button and then double-click the boundary below one of the row headings.

Change the height of rows by using the mouse

Do one of the following:

To change the row height of one row, drag the boundary below the row heading until the row is the height that you want.

To change the row height of multiple rows, select the rows that you want to change, and then drag the boundary below one of the selected row headings.

To change the row height for all rows on the worksheet, click the Select All button, and then drag the boundary below any row heading.

To change the row height to fit the contents, double-click the boundary below the row heading.

Merge cells or split merged cells

When you merge two or more adjacent horizontal or vertical cells, the cells become one large cell that is displayed across multiple columns or rows. The contents of one of the cells appear in the center of the merged cell (merged cell: A single cell that is created by combining two or more selected cells. The cell reference for a merged cell is the upper-left cell in the original selected range.), as shown in the following example.

You can split a merged cell into separate cells again but you cannot split a single cell that has not been merged.

Merge adjacent cells

1. Select two or more adjacent cells that you want to merge.

.

2. On the Home tab, in the Alignment group, click Merge and Center.

The cells will be merged in a row or column, and the cell contents will be centered in the merged cell. To merge cells without centering, click the arrow next to Merge and Center, and then click Merge Across or Merge Cells.

3. To change the text alignment in the merged cell, select the cell, click any of the alignment buttons in the Alignment group on the Home tab.

Split a merged cell

- Select the merged cell.

When you select a merged cell, the Merge and Center button  also appears selected in the Alignment group on the Home tab.

Add, edit, or delete a comment

In Microsoft Office Excel, you can add a note to a cell by inserting a comment. You can edit the text in comments and delete comments that you no longer need.

Add a comment

1. Click the cell that you want to add a comment to.
2. On the Review tab, in the Comments group, click New Comment.

3. In the comment text box, type the comment text.
4. To format the text, select it, and then use the formatting options on the Home tab in the Font group.

Note The Fill Color and Font Color options in the Font group are not available for comment text. To change the color of the text, right-click the comment, and then click Format Comment.

5. When you finish typing and formatting the text, click outside of the comment box.

Notes

To keep a comment visible with the cell, you can select the cell that contains the comment and then click Show/Hide Comment in the Comments group on the Review tab. To display all comments with their cells on the worksheet, click Show All Comments.

Edit a comment

Click the cell that contains the comment that you want to edit.

Do one of the following:

On the Review tab, in the Comments group, click Edit Comment.

Note Edit Comment is available in the Comments group instead of New Comment when a cell that contains a comment is selected.

On the Review tab, in the Comments group, click Show/Hide Comment to display the comment, and then double-click the text in the comment.

In the comment text box, edit the comment text.

To format the text, select it, and then use the formatting options on the Home tab in the Font group.

Delete a comment

- Click the cell that contains the comment that you want to delete.
- Do one of the following:
 - On the Review tab, in the Comments group, click Delete.
 - On the Review tab, in the Comments group, click Show/Hide Comment to display the comment, double-click the comment text box, and then press DELETE.

Selecting and Navigating

Select cells and their contents on a worksheet
 Select specific cells or ranges
 Select all cells on a worksheet

To select all cells on a worksheet, do one of the following:

- Click the Select All button.

- Press CTRL+A.

Select one or multiple worksheets

To select	Do this
-----------	---------

A single sheet

Click the sheet tab.

If you don't see the tab that you want, click the tab scrolling buttons to display the tab, and then click the tab.

Two or more adjacent sheets	Click the tab for the first sheet. Then hold down SHIFT while you click the tab for the last sheet that you want to select.
Two or more nonadjacent sheets	Click the tab for the first sheet. Then hold down CTRL while you click the tabs of the other sheets that you want to select.
All sheets in a workbook	Right-click a sheet tab, and then click Select All Sheets on the shortcut menu (shortcut menu: A menu that shows a list of commands relevant to a particular item. To display a shortcut menu, right-click an item or press SHIFT+F10.).

Copying and Moving

Move or copy cells and cell contents

Using the **Cut**, **Copy**, and **Paste** commands in Microsoft Office Excel, you can move or copy entire cells or their contents. You can also copy specific contents or attributes from the cells. For example, you can copy the resulting value of a formula without copying the formula itself, or you can copy only the formula.

NOTE Excel displays an animated moving border around cells that have been cut or copied. To cancel a moving border, press ESC.

Move or copy entire cells by using the mouse

Tip To cancel a selection of cells, click any cell on the worksheet.

- Do one of the following:
 - To move a cell or range of cells, point to the border of the selection. When the pointer becomes a move pointer , drag the cell or range of cells to another location.
 - To copy a cell or range of cells, hold down CTRL while you point to the border of the selection. When the pointer becomes a copy pointer , drag the cell or range of cells to another location.

Formatting Data

Formatting Numbers

Insert a symbol, fraction, or special character

You can use the Symbol dialog box to insert symbols, such as ¼ and ©, or special characters, such as an em dash (—) or ellipsis (...) that are not on your keyboard, as well as Unicode (Unicode: A character encoding standard developed by the Unicode Consortium. By using more than one byte to represent each character, Unicode enables almost all of the written languages in the world to be represented by using a single character set.) characters.

Available number formats

By applying different number formats, you can change the appearance of numbers without changing the number. A number format does not affect the actual cell value that Microsoft Office Excel uses to perform calculations. The actual value is displayed in the formula bar (formula bar: A bar at the top of the Excel window that you use to enter or edit values or formulas in cells or charts. Displays the constant value or formula stored in the active cell.).

Formula bar and related cell

Fill cells with solid colors

Select the cells that you want to apply shading to or remove shading from.

Tip To cancel a selection of cells, click any cell on the worksheet.

On the Home tab, in the Font group, do one of the following:

To fill cells with a solid color, click the arrow next to Fill Color  in the Font group on the Home tab, and then click the color on the palette that you want.

To apply the most recently selected color, click Fill Color .

Fill cells with patterns

Select the cells that you want to fill with a pattern.

Tip To cancel a selection of cells, click any cell on the worksheet.

On the Home tab, click the Dialog Box Launcher  next to Font, and then click the Fill tab.

Under Background Color, click the background color that you want to use.

Do one of the following:

To use a pattern with two colors, click another color in the Pattern Color box, and then click a pattern style in the Pattern Style box.

To use a pattern with special effects, click Fill Effects, and then click the options that you

Add formatting to your document by using the Mini toolbar

When you select text, you can show or hide a handy, miniature, semitransparent toolbar called the Mini toolbar. The Mini toolbar helps you work with fonts, font styles, font sizing, alignment, text color, indent levels, and bullet features.

The following shows how the semitransparent toolbar looks when you select text on a slide or in a shape in Microsoft Office PowerPoint 2007.

The following shows the Mini toolbar when you rest your pointer on it. To use the toolbar, click any of the available commands.

Apply a document theme

You can change the document theme that is applied by default in Office programs, such as Word, Excel, and PowerPoint, by selecting another predefined document theme or a custom document theme. Document themes that you apply immediately affect the styles (style: A combination of formatting characteristics, such as font, font size, and indentation, that you name and store as a set. When you apply a style, all of the formatting instructions in that style are applied at one time.) that you can use in your document.

Do one of the following:

In Word or Excel: On the Page Layout tab, in the Themes group, click Themes.

Do one of the following:

To apply a predefined document theme, click the document theme that you want to use under Built-In.

To apply a custom document theme, click the document theme that you want to use under Custom.

Add a sheet background

Click the worksheet that you want to display with a sheet background. Make sure that only one worksheet is selected.

On the Page Layout tab, in the Page Setup group, click Background.

Select the picture that you want to use for the sheet background, and then click Insert.

The selected picture is repeated to fill the sheet.

Apply or remove cell borders on a worksheet

By using predefined border styles, you can quickly add a border around cells or ranges (range: Two or more cells on a sheet. The cells in a range can be adjacent or nonadjacent.) of cells.

On a worksheet, select the cell or range of cells that you want to add a border to, to change the border style on, or to remove a border from.

Tip To cancel a selection of cells, click any cell on the worksheet.

On the Home tab, in the Font group, do one of the following:

To apply a new or different border style, click the arrow next to Borders , and then click a border style.

Tip To apply a custom border style or a diagonal border, click More Borders. On the Border tab, under Line and Color, click the line style and color that you want. Under Presets and

Border, click one or more buttons to indicate the border placement. Two diagonal border buttons   are available under Border.

To remove cell borders, click the arrow next to Borders , and then click No Border .

Mimic a watermark in Excel

Watermark functionality is not available in Microsoft Office Excel. If you want to display a graphic on every printed page (for example, to indicate that the information is confidential), you can insert the graphic in a header or footer. This way, the graphic appears behind the text, starting at the top or bottom of every page. You can also resize or scale the graphic to fill the page.

Click the worksheet that you want to display with a watermark. Make sure that only one worksheet is selected.

On the Insert tab, in the Text group, click Header & Footer.

Under Header, click in the Left section, Center section, or Right section box.

On the Design tab of the Header & Footer Tools, in the Header & Footer elements group, click Picture  and then find the graphic that you want to insert.

Double-click the graphic to insert it in the header section box.

To resize or scale the graphic, click Format Picture  in the Header & Footer elements group, and then, in the Format Picture dialog box, select the options that you want on the Size tab.

Choose a table style when you create a table

On the worksheet, select a range of cells that you want to quickly format as a table.

On the Home tab, in the Styles group, click Format as Table.

Under Light, Medium, or Dark, click the table style that you want to use.

Apply a table style to an existing table

On the worksheet, select the table to which you want to apply a table style.

On the Design tab, in the Table Styles group, do one of the following:

Click the table style that you want to use.

Click the More button , and then under Light, Medium, or Dark, click the table style that you want to use.

Formatting Numbers

Available number formats

By applying different number formats, you can change the appearance of numbers without changing the number. A number format does not affect the actual cell value that Microsoft Office Excel uses to perform calculations. The actual value is displayed in the

The following is a summary of the number formats that are available on the Home tab in the Number group. To see all available number formats, click the Dialog Box Launcher  next to Number.

Using Tables

Overview of Excel tables

To make managing and analyzing a group of related data easier, you can turn a range (range: Two or more cells on a sheet. The cells in a range can be adjacent or nonadjacent.) of cells into a Microsoft Office Excel table (previously known as an Excel list). A table is a series of rows and columns that contains related data that is managed independently from the data in other rows and columns on the worksheet (worksheet: The primary document that you use in Excel to store and work with data. Also called a spreadsheet. A worksheet consists of cells that are organized into columns and rows; a worksheet is always stored in a workbook.).

Column1	Column2
Total	0

By default, every column in the table has filtering enabled in the header row so that you can filter or sort your table data quickly. You can add a total row (total row: A special row in a list that provides a selection of aggregate functions useful for working with numerical data.) to your table that provides a drop-down list of aggregate functions for each total row cell. A sizing handle in the lower-right corner of the table allows you to drag the table to the size that you want.

Create a table

- On a worksheet, select the range of empty cells or data that you want to make into a table.
- On the Insert tab, in the Tables group, click Table.

- If the selected range contains data that you want to display as table headers, select the My table has headers check box.

Table headers display default names that you can change if you don't select the My table has headers check box.

Convert a table to a range of data

- Click anywhere in the table.
- On the Design tab, in the Tools group, click Convert to Range.

Delete a table

- On a worksheet, select a table.
- Press DELETE.

The Department Sales table example

The following is an example, referenced throughout this article, of a table that is based on sales in a department of six employees with the latest sales amounts and commissions.

A Department Sales table

	A	B	C	D	E
1	SalesPers	Region	SaleAmt	ComPct	ComAmt
2	Joe	North	\$260	10%	\$26.00
3	Robert	South	\$660	15%	\$99.00
4	Michelle	East	\$940	15%	\$141.00
5	Erich	West	\$410	12%	\$49.20
6	Dafna	North	\$800	15%	\$120.00
7	Rob	South	\$900	15%	\$135.00
8	Total	6	\$3,970	14%	\$95.03
9					

1 The entire table (A1:E8)

- 2 The table data (A2:E8)
- 3 A column and column header (D1:D8)
- 4 A calculated column (E1:E8)
- 5 The Totals row (A8:E8)

An Excel table to a range of data

You can remove an Excel table by converting it to a range of data.

- Click anywhere in the table.
- On the Design tab, in the Tools group, click Convert to Range.

Total the data in an Excel table

You can quickly total the data in a Microsoft Office Excel table by displaying a totals row at the end of the table and then by using the functions that are provided in drop-down lists for each totals row cell.

1. Click anywhere in the table.
2. On the Design tab, in the Table Style Options group, select the Total Row check box.

3. In the total row, click the cell in the column for which you want to calculate a total, and then click the drop-down list arrow that appears.
4. In the drop-down list, select the function that you want to use to calculate the total.

Filter data in a range or table

Using AutoFilter to filter data is a quick and easy way to find and work with a subset of data in a range of cells or table column. Filtered data displays only the rows that meet criteria (criteria: Conditions you specify to limit which records are included in the result set of a query or filter.) that you specify and hides rows that you do not want displayed. After you filter data, you can copy, find, edit, format, chart, and print the subset of filtered data without rearranging or moving it.

Filter text

- Select a range of cells containing alphanumeric data.
- On the Home tab, in the Editing group, click Sort & Filter, and then click Filter.

Table

- Make sure that the active cell is in a table column that contains alphanumeric data.

2. Click the arrow  in the column header.

3. Do one of the following:

Select from a list of text values

- In the list of text values, select or clear one or more text values to filter by.

The list of text values can be up to 10,000. If the list is large, clear (Select All) at the top, and then select the specific text values to filter by.

Create criteria

For example, to filter by text that begins with a specific character, select Begins With, or to filter by text that has specific characters anywhere in the text, select Contains.

- In the Custom AutoFilter dialog box, in the box on the right, enter text or select the text value from the list.

For example, to filter by text that begins with the letter "J", enter J, or to filter by text that has "bell" anywhere in the text, enter bell.

If you need to find text that shares some characters but not others, use a wildcard character.

 How to use wildcard characters

Use	To find
? (question mark)	Any single character For example, sm?th finds "smith" and "smyth"
* (asterisk)	Any number of characters For example, *east finds "Northeast" and "Southeast"

Filter numbers

1. Do one of the following:

Range of cells

- Select a range of cells containing numeric data.
- On the Home tab, in the Editing group, click Sort & Filter, and then click Filter.

Table

1. Make sure that the active cell is in a table column that contains numeric data.
2. Click the arrow  in the column header.
3. Do one of the following:

Select from a list of numbers

1. In the list of numbers, select or clear one or more numbers to filter by.

The list of numbers can be up to 10,000. If the list is large, clear (Select All) at the top, and then select the specific numbers to filter by.

Create criteria

- Point to Number Filters and then click one of the comparison operator (comparison operator: A sign that is used in comparison criteria to compare two values. Operators include: = Equal to, > Greater than, < Less than, >= Greater than or equal to, <= Less than or equal to, and <> Not equal to.) commands or click Custom Filter.

For example, to filter by a lower and upper number limit, select Between.

- In the Custom AutoFilter dialog box, in the box or boxes on the right, enter numbers or select numbers from the list.

For example, to filter by a lower number of 25 and an upper number of 50, enter 25 and 50.

- Optionally, filter by one more criteria.

 How to add one more criteria

1. Do one of the following:

1. To filter the table column or selection so that both criteria must be true, select And.
2. To filter the table column or selection so that either or both criteria can be true, select Or.
2. In the second entry, select a comparison operator, and then in the box on the right, enter a number or select a number from the list.

Filter dates or times

1. Do one of the following:

Range of cells

- Select a range of cells containing numeric data.
- On the Home tab, in the Editing group, click Sort & Filter, and then click Filter.

Table

1. Make sure that the active cell is in a table column that contains dates or times.
2. Click the arrow  in the column header.
3. Do one of the following:

Select from a list of dates or times

1. In the list of dates or times, select or clear one or more dates or times to filter by.

By default, all dates in the range of cells or table column are grouped by a hierarchy of years, months, and days. Selecting or clearing a higher level in the hierarchy selects or clears all nested dates below

that level. For example, if you select 2006, months are listed below 2006, and days are listed below each month.

Create criteria

1. Click one of the comparison operator commands (Equals, Before, After, or Between) or click Custom Filter.
2. In the Custom AutoFilter dialog box, in the box on the right, enter a date or time, select a date or time from the list, or click the Calendar button to find and enter a date.

For example, to filter by a lower and upper date or time, select Between.

3. In the Custom AutoFilter dialog box, in the box or boxes on the right, enter a date or time, select dates or times from the list, or click the Calendar button to find and enter a date.

For example, to filter by an earlier date of "3/1/2006" and a later date of "6/1/2006", enter 3/1/2006 and 6/1/2006. Or, to filter by an earlier time of "8:00 AM" and a later time of "12:00 PM", enter 8:00 AM and 12:00 PM.

Dynamic filter

Note A dynamic filter is one where the criteria can change when you reapply the filter.

4. Click one of the pre-defined date commands.

For example, to filter all dates by the current date, select Today, or by the following month, select Next Month.

5. Click OK.

2. Optionally, filter by one more criteria.

Filter for unique values

1. Select the range of cells, or make sure the active cell is in a table.
2. On the Data tab, in the Sort & Filter group, click Advanced.

3. In the Advanced Filter dialog box, do one of the following:
 - To filter the range of cells or table in place, click Filter the list, in-place.
 - To copy the results of the filter to another location, do the following:
 1. Click Copy to another location.
 2. In the Copy to box, enter a cell reference.

Alternatively, click Collapse Dialog  to temporarily hide the dialog box, select a cell on the worksheet, and then press Expand Dialog .

4. Select the Unique records only check box, and click OK.

The unique values from the selected range are copied to the new location

Sort data in a range or table

Sorting data is an integral part of data analysis. You might want to put a list of names in alphabetical order, compile a list of product inventory levels from highest to lowest, or order rows by colors or icons. Sorting data helps you quickly visualize and understand your data better, organize and find the data that you want, and ultimately make more effective decisions.

Learn about sorting

You can sort data by text (A to Z or Z to A), numbers (smallest to largest or largest to smallest), and dates and times (oldest to newest and newest to oldest) in one or more columns. You can also sort by a custom list (such as Large,

Medium, and Small) or by format, including cell color, font color, or icon set. Most sort operations are column sorts, but you can also sort by rows.

Sort text

1. Select a column of alphanumeric data in a range of cells, or make sure that the active cell is in a table column containing alphanumeric data.
2. On the Home tab, in the Editing group, and then click Sort & Filter.

3. Do one of the following:
 1. To sort in ascending alphanumeric order, click Sort A to Z.
 2. To sort in descending alphanumeric order, click Sort Z to A.
4. Optionally, you can do a case-sensitive sort.

How to sort by case-sensitivity

1. On the Home tab, in the Editing group, click Sort & Filter, and then click Custom Sort.
2. In the Sort dialog box, click Options.
3. In the Sort Options dialog box, select Case sensitive.
4. Click OK twice.

Add, change, or clear conditional formats

Use a conditional format to help you visually explore and analyze data, detect critical issues, and identify patterns and trends.

Learn more about conditional formatting

Whenever you analyze data, you often ask yourself questions, such as:

1. Where are the exceptions in a summary of profits over the past five years?
2. What are the trends in a marketing opinion poll over the past two years?
3. Who has sold more than \$50,000 dollars this month?
4. What is the overall age distribution of employees?
5. Which products have greater than 10% revenue increases from year to year?
6. Who are the highest performing and lowest performing students in the freshman class?

Format all cells by using a two-color scale

Color scales are visual guides that help you understand data distribution and variation. A two-color scale helps you compare a range of cells by using a gradation of two colors. The shade of the color represents higher or lower values. For example, in a green and red color scale, you can specify higher value cells have a more green color and lower value cells have a more red color.

Quick formatting

1. Select a range of cells, or make sure that the active cell is in a table or PivotTable report.
2. On the Home tab, in the Styles group, click the arrow next to Conditional Formatting, and then click Color Scales.

Format all cells by using a three-color scale

Color scales are visual guides that help you understand data distribution and variation. A three-color scale helps you compare a range of cells by using a gradation of three colors. The shade of the color represents higher, middle, or lower values. For example, in a green, yellow, and red color scale, you can specify higher value cells have a green color, middle value cells have a yellow color, and lower value cells have a red color.

Quick formatting

1. Select a range of cells, or make sure that the active cell is in a table or PivotTable report.
2. On the Home tab, in the Styles group, click the arrow next to Conditional Formatting, and then click Color Scales.

3. Select a three-color scale. The top color represents higher values, the center color represents middle values, and the bottom color represents lower values.

Format all cells by using data bars

A data bar helps you see the value of a cell relative to other cells. The length of the data bar represents the value in the cell. A longer bar represents a higher value and a shorter bar represents a lower value. Data bars are useful in spotting higher and lower numbers especially with large amounts of data, such as top and bottom selling toys in a holiday sales report.

Quick formatting

1. Select a range of cells, or make sure that the active cell is in a table or PivotTable report.
2. On the Home tab, in the Style group, click the arrow next to Conditional Formatting, click Data Bars, and then select a data bar icon.

Format all cells by using an icon set

Use an icon set to annotate and classify data into three to five categories separated by a threshold value. Each icon represents a range of values. For example, in the 3 Arrows icon set, the red up arrow represents higher values, the

yellow sideways arrow represents middle values, and the green down arrow represents lower values.

Quick formatting

1. Select a range of cells, or make sure that the active cell is in a table or PivotTable report.
2. On the Home tab, in the Style group, click the arrow next to Conditional Formatting, click Icon Set, and then select an icon set.

Validating Data

Create a drop-down list from a range of cells

To make data entry easier, or to limit entries to certain items that you define, you can create a drop-down list of valid entries that is compiled from cells elsewhere in the workbook. When you create a drop-down list for a cell, it displays an arrow in that cell. To enter information in that cell, click the arrow, and then click the entry that you want.

To create a drop-down list from a range of cells, use the **Data Validation** command in the **Data Tools** group on the **Data** tab.

1. To create a list of valid entries for the drop-down list, type the entries in a single column or row without blank cells. For example:

	A
1	Sales
2	Finance
3	R&D
4	MIS

Note You cannot name a cell while you are changing the contents of the cell.

2. Select the cell where you want the drop-down list.
3. On the Data tab, in the Data Tools group, click Data Validation.

The Data Validation dialog box is displayed.

4. Click the Settings tab.
5. In the Allow box, click List.
6. To specify the location of the list of valid entries, do one of the following:

If the list is in the current worksheet, enter a reference to your list in the Source box.

1. Make sure that the In-cell drop-down check box is selected.
2. To specify whether the cell can be left blank, select or clear the Ignore blank check box.
3. Optionally, display an input message when the cell is clicked.

 How to display an input message

1. Click the Input Message tab.
2. Make sure that the Show input message when cell is selected check box is selected.
3. Type the title and text for the message (up to 225 characters).
4. Specify how you want Microsoft Office Excel to respond when invalid data is entered.

 How to specify a response to invalid data

1. Click the Error Alert tab, and make sure that the Show error alert after invalid data is entered check box is selected.
2. Select one of the following options for the Style box:
 1. To display an information message that does not prevent entry of invalid data, click Information.
 2. To display a warning message that does not prevent entry of invalid data, click Warning.
 3. To prevent entry of invalid data, click Stop.
3. Type the title and text for the message (up to 225 characters).

Prevent invalid data entry in a worksheet

In many worksheets that you create, users will enter data to get the desired calculations and results. Ensuring valid data entry is an important task. You may want to restrict data entry to a certain range of dates, limit choices by using a list, or make sure that only positive whole numbers are entered. Providing immediate help to instruct users and clear messages when invalid data is entered is also essential to make the data entry experience go smoothly.

Once you decide what validation you want to use on a worksheet, you can set up the validation by doing the following:

1. Select one or more cells to validate.
2. On the Data tab, in the Data Tools group, click Data Validation.

The Data Validation dialog box is displayed.

3. Click the Settings tab.
4. To specify the type of validation that you want, do one of the following:
 1. In the Allow box, select List.
 2. Click the Source box and then type the list values separated by the Microsoft Windows list separator character (commas by default).

For example:

1. To limit entry to a question, such as "Do you have children?", to two choices, type Yes, No.
2. To limit a vendor's quality reputation to three ratings, type Low, Average, High.
3. Make sure that the In-cell dropdown check box is selected.

☒ Allow a whole number within limits

4. In the Allow box, select Whole Number.
5. In the Data box, select the type of restriction that you want. For example, to set upper and lower limits, select between.
6. Enter the minimum, maximum, or specific value to allow. You can also enter a formula that returns a number value.

For example, to set a minimum limit of deductions to two times the number of children in cell F1, select greater than or equal to in the Data box and enter the formula, =2*F1, in the Minimum box.

☒ Allow a decimal number within limits

7. In the Allow box, select Decimal.
8. In the Data box, select the type of restriction that you want. For example, to set upper and lower limits, select between.
9. Enter the minimum, maximum, or specific value to allow. You can also enter a formula that returns a number value.

For example, to set a maximum limit for commissions and bonuses of 6% of a salesperson's salary in cell E1, select less than or equal to in the Data box and enter the formula, =E1*6%, in the Maximum box.

10. In the Allow box, select Date.
11. In the Data box, select the type of restriction that you want. For example, to allow dates after a certain day, select greater than.
12. Enter the start, end, or specific date to allow. You can also enter a formula that returns a date.

For example, to set a time frame between today's date and 3 days from today's date, select between in the Data box, enter =TODAY() in the Minimum box, and enter =TODAY()+3 in the Maximum box.

13. In the Allow box, select Time.
14. In the Data box, select the type of restriction that you want. For example, to allow times before a certain time of day, select less than.
15. Enter the start, end, or specific time to allow. You can also enter a formula that returns a time value.

16. In the Allow box, select Text Length.
17. In the Data box, select the type of restriction that you want. For example, to allow up to a certain number of characters, select less than or equal to.
18. Enter the minimum, maximum, or specific length for the text. You can also
19. In the Allow box, select the type of data that you want.

20. In the Data box, select the type of restriction that you want.

Summarizing, consolidating, and Out ling data

Insert subtotals in a list of data in a worksheet

1	2	3	A	B
1			Sport	Sales
2			Golf	\$5,000
3			Golf	\$2,000
4			Golf	\$1,500
5			Golf Total	\$8,500
6			Safari	\$9,000
7			Safari	\$4,000
8			Safari Total	\$13,000
9			Tennis Total	\$2,000
10			Grand Total	\$23,500

You can automatically calculate subtotals and grand totals in a list (list: A series of rows that contains related data or a series of rows that you designate to function as a datasheet by using the Create List command.) for a column by using the **Subtotal** command in the **Outline** group on the **Data** tab.

Subtotals are calculated with a summary function (summary function: A type of calculation that combines source data in a PivotTable report or a consolidation table, or when you are inserting automatic subtotals in a list or database. Examples of summary functions include Sum, Count, and Average.), such as Sum or Average, by using the SUBTOTAL function. You can display more than one type of summary function for each column.

Grand totals are derived from detail data (detail data: For automatic subtotals and worksheet outlines, the subtotal rows or columns that are totaled by summary data. Detail data is typically adjacent to and either above or to the left of the summary data.), not from the values in the subtotals. For example, if you use the Average summary function, the grand total row displays an average of all detail rows in the list, not an average of the values in the subtotal rows.

If the workbook is set to automatically calculate formulas, the Subtotal command recalculates subtotal and grand total values automatically as you edit the detail data. The Subtotal command also outlines (outline: Worksheet data in which rows or columns of detail data are grouped so that you can create summary reports. The outline can summarize either an entire worksheet or a selected portion of it.) the list so that you can display and hide the detail rows for each subtotal.

Make sure that each column has a label in the first row, contains similar facts in each column, and that the range has no blank rows or columns.

Select a cell in the range.

Do one of the following:

- ☒ Insert one level of subtotals

You can insert one level of subtotals for a group of data as shown in the following example.

	A	B	C
1	Region	Sport	Sales
2	East	Golf	\$5,000
3	East	Golf	\$2,000
4	East	Golf	\$1,500
5		Golf Total	\$8,500
6	East	Safari	\$9,000
7	East	Safari	\$4,000
8		Safari Total	\$13,000

1 At each change in the Sport column...

2...subtotal the Sales column.

Sort the column that forms the group.

On the Data tab, in the Outline group, click Subtotal.

The Subtotal dialog box is displayed.

In the At each change in box, click the column to subtotal. In the example above, you would select Sport.

In the Use function box, click the summary function that you want to use to calculate the subtotals. In the example above, you would select Sum.

In the Add subtotal to box, select the check box for each column that contains values that you want to subtotal. In the example above, you would select Sales.

Remove subtotals

When you remove subtotals, Microsoft Office Excel also removes the outline (outline: Worksheet data in which rows or columns of detail data are grouped so that you can create summary reports. The outline can summarize either an entire worksheet or a selected portion of it.) and any page breaks that you inserted into the list along with the subtotals.

Click a cell in the list that contains a subtotal.

On the Data tab, in the Outline group, click Subtotal.

The Subtotal dialog box is displayed.

Click Remove All.

Consolidate data in multiple worksheets

To summarize and report results from separate worksheets, you can consolidate data from each separate worksheet into a master worksheet. The worksheets can be in the same workbook as

the master worksheet or in other workbooks. When you consolidate data, you are assembling data so that you can more easily update and aggregate it on a regular or ad hoc basis.

To consolidate data, use the Consolidate command in the Data Tools group on the Data tab.

Change a data consolidation of multiple worksheets

11

After you have consolidated data from multiple worksheets, you may want to change the way that the data is consolidated. For example, you may want to add worksheets from new regional offices, delete worksheets from departments that no longer exist, or change formulas

Change a consolidation made by position or category

Click the upper-left cell in the consolidated data.

On the Data tab, in the Data Tools group, click Consolidate.

Do one or more of the following:

Add another source range to the consolidation

The new source range must have either data in the same positions (if you previously consolidated by position) or column labels that match those in the other ranges in the consolidation (if you previously consolidated by category) .

If the worksheet is in another workbook, click Browse to locate the file, and then click OK to close the Browse dialog box.

The file path is entered in the Reference box followed by an exclamation point.

Type the name that you gave the range, and then click Add.

Adjust the size or shape of a source range

Under All references, click the source range that you want to change.

In the Reference box, edit the selected reference.

Click Add.

Delete a source range from the consolidation

Under All references, click the source range that you want to delete.

Click Delete.

Make the consolidation update automatically

Important You can only select this check box if the worksheet is in another workbook. Once you select this check box, you won't be able to change which cells and ranges are included in the consolidation.

Select the Create links to source data check box.

To update the consolidation with the changes, click OK.

Outline a list of data in a worksheet

If you have a list (list: A series of rows that contains related data or a series of rows that you designate to function as a datasheet by using the Create List command.) of data that you want to group and summarize, you can create an outline of up to eight levels, one for each group. Each inner level, represented by a higher number in the outline symbols (outline symbols: Symbols that you use to change the view of an outlined worksheet. You can show or hide detailed data by pressing the plus sign, minus sign, and the numbers 1, 2, 3, or 4, indicating the outline level.) displays detail data (detail data: For automatic subtotals and worksheet outlines, the subtotal rows or columns that are totaled by summary data. Detail data is typically adjacent to and either above or to the left of the summary data.) for the preceding outer level, represented by a lower number in the outline symbols. Use an outline to quickly display summary rows or columns, or to reveal the detail data for each group. You can create an outline of rows (as shown in the example below), an outline of columns, or an outline of both rows and columns.

1	2	3	A	B	C
1	Region	Month	Sales		
4	East	AprTotal	11,034		
7	East	MarTotal	11,075		
10	West	AprTotal	9,643		
11	West	Mar	3,036		
12	West	Mar	7,113		
13	West	Mar	8,751		
14	West	MarTotal	18,900		
15	All Sales		50,652		

1 To display rows for a level, click the appropriate **1 2 3** outline symbols.

2 Level 1 contains the total sales for all detail rows.

3 Level 2 contains total sales for each month in each region.

4 Level 3 contains detail rows (only detail rows 11 through 13 are

An outlined row of sales data grouped by geographical regions and months with several summary and detail rows displayed.

currently visible).

5 To expand or collapse data in your outline, click the  and  outline symbols.

Outline the data manually

Important When you manually group outline levels, it's best to have all data displayed to avoid grouping the rows incorrectly.

Outline the outer group.

 How to outline the outer group

Select all of the subordinate summary rows, as well as their related detail data.

In the example below, row 6 contains the subtotals for rows 2 through 5, and row 10 contains the subtotals for rows 7 through 9, and row 11 contains the grand totals. To group all of the detail data for row 11, select rows 2 through 10.

	A	B	C
1	Region	Month	Sales
2	East	March	\$9,647
3	East	March	\$4,101
4	East	March	\$7,115
5	East	March	\$2,957

6	East	Mar Total	\$23,820
7	East	April	\$4,257
8	East	April	\$1,829
9	East	April	\$6,550
10	East	Apr Total	\$12,636
11	East Total		\$36,456

Important Do not include the summary row 11 in the selection.

On the Data tab, in the Outline group, click Group.

The outline symbols appear beside the group on the screen.

Optionally, outline an inner, nested group.

 How to outline the inner, nested group

For each inner, nested group, select the detail rows adjacent to the row that contains the summary row.

In the example below, to group rows 2 through 5, which has a summary row 6, select rows 2 through 5. To group rows 7 through 9, which has a summary row 10, select rows 7 through 9.

	A	B	C
1	Region	Month	Sales

2	East	March	\$9,647
3	East	March	\$4,101
4	East	March	\$7,115
5	East	March	\$2,957
6	East	Mar Total	\$23,820
7	East	April	\$4,257
8	East	April	\$1,829
9	East	April	\$6,550
10	East	Apr Total	\$12,636
11	East Total		\$36,456

Important Do not include the summary row for that group in the selection.

On the Data tab, in the Outline group, click Group.

The outline symbols appear beside the group on the screen.

Create an outline of columns

Make sure that each row has a label in the first column, contains similar facts in each row, and that the range has no blank rows or columns.

Select a cell in the range.

Sort the rows that form the groups.

For more information on sorting, see [Sort data in a range or table](#).

Insert your own summary columns with formulas immediately to the right or left of each group of detail columns.

Specify whether the location of the summary column is to the right or left of the detail columns.

How to specify the summary column location

On the Data tab, in the Outline group, click the Outline Dialog Box Launcher.

To specify a summary column to the left of the details column, clear the Summary columns to right of detail check box. To specify a summary column to the right of the details column, select the Summary columns to right of detail check box.

Outline the data. Do one of the following:

Show or hide outlined data

If you don't see the outline symbols , click the Microsoft Office Button , click Excel Options, click the Advanced category, and then under the Display for this worksheet section, select the worksheet, and select the Show outline symbols if an outline is applied check box.

Do one or more of the following:

Show or hide the detail data for a group

To display the detail data within a group, click the  for the group.

To hide the detail data for a group, click the  for the group.

Expand or collapse the entire outline to a particular level

In the  outline symbols, click the number of the level that you want. Detail data at lower levels is then hidden.

For example, if an outline has four levels, you can hide the fourth level while displaying the rest of the levels by clicking .

Show or hide all of the outlined detail data

To show all detail data, click the lowest level in the **1 2 3** outline symbols. For example, if there are three levels, click **3**.

To hide all detail data, click **1**.

Importing Data

Import or export text files

There are two ways to import data from a text file by using Microsoft Office Excel: You can open the text file in Excel, or you can import the text file as an external data range (external data range: A range of data that is brought into a worksheet but that originates outside of Excel, such as in a database or text file. In Excel, you can format the data or use it in calculations as you would any other data.). To export data from Excel to a text file, use the **Save As** command.

There are two commonly used text file formats:

1. Delimited text files (.txt), in which the TAB character (ASCII character code 009) usually separates each field of text.
2. Comma separated values text files (.csv), in which the comma character (,) usually separates each field of text.

You can change the separator character that is used in both delimited and .csv text files. This may be necessary to make sure that the import or export operation works the way that you want it to.

Text Import Wizard

You can use Microsoft Office Excel to import data from a text file into a worksheet. The Text Import Wizard examines the text file that you are importing and helps you ensure that the data is imported in the way that you want.

Connect to (Import) external data

The main benefit of connecting to external data is that you can periodically analyze this data in Microsoft Office Excel without repeatedly copying the data, which is an operation that can be time-consuming and error-prone. After connecting to external data, you can also automatically refresh (or update) your Excel workbooks from the original data source whenever the data source is updated with new information.

Exchange (copy, import, export) data between Excel and Access

Connect to Access data from Excel

To bring refreshable Access data into Excel, you can create a connection, often stored in an Office Data Connection file (.odc), to the Access database and retrieve all of the data from a

table or query. The main benefit of connecting to Access data is that you can periodically analyze this data in Excel without

repeatedly copying or exporting the data from Access.

1. Click the cell where you want to put the data from the Access database.
2. On the Data tab, in the Get External Data group, click From Access.
3. In the Look in list, locate and double-click the Access database that you want to import.

In the Select Table dialog box, click the table or query that you want to import, and then click OK.

4. In the Import Data dialog box, do the following:
 1. Under Select how you want to view this data, do one of the following:
 1. Optionally, click Properties to set refresh, formatting, and layout options for the imported data, and then click OK.
 2. Under Where do you want to put the data? do one of the following:
 1. To return the data to the location that you selected, click Existing worksheet.
 2. To return the data to the upper-left corner of the new worksheet, click New worksheet.
5. Click OK.

Pivot Table Report and Pivot Chart Report

Overview of PivotTable reports and PivotChart reports

Use a PivotTable report to summarize, analyze, explore, and present summary data. Use a PivotChart report to visualize this summary data in a PivotTable report, and to easily see comparisons, patterns, and trends. Both a PivotTable report and a PivotChart report enable you to make informed decisions about critical data in your enterprise. The following sections provide an overview of PivotTable reports and PivotChart reports

About PivotTable reports

A PivotTable report is an interactive way to quickly summarize large amounts of data. Use a PivotTable report to analyze numerical data in depth and to answer unanticipated questions about your data. A PivotTable report is especially designed for:

1. Querying large amounts of data in many user-friendly ways.
2. Subtotaling and aggregating numeric data, summarizing data by categories and subcategories, and creating custom calculations and formulas.

3. Expanding and collapsing levels of data to focus your results, and drilling down to details from the summary data for areas of interest.
4. Moving rows to column or columns to rows (or "pivoting") to see different summaries of the source data.
5. Filtering, sorting, grouping, and conditionally formatting the most useful and interesting subset of data to enable you to focus on the information that you want.
6. Presenting concise, attractive, and annotated online or printed reports.

You often use a PivotTable report when you want to analyze related totals, especially when you have a long list of figures to sum and you want to compare several facts about each figure. In the PivotTable report illustrated below, you can easily see how the third-quarter golf sales in cell F3 compare to sales for another sport, or quarter, or to the total sales.

You often use a PivotTable report when you want to analyze related totals, especially when you have a long list of figures to sum and you want to compare several facts about each figure. In the PivotTable report illustrated below, you can easily see how the third-quarter golf sales in cell F3 compare to sales for another sport, or quarter, or to the total sales.

	A	B	C
1	Sport	Quarter	Sales
2	Golf	Qtr3	\$1,500
3	Golf	Qtr4	\$2,000
4	Tennis	Qtr3	\$600
5	Tennis	Qtr4	\$1,500
6	Tennis	Qtr3	\$4,070
7	Tennis	Qtr4	\$5,000
8	Golf	Qtr3	\$6,430

1 Source data, in this case, from a worksheet

2 The source values for Qtr3 Golf summary in the PivotTable report

3 The entire PivotTable report

4 The summary of the source values in C2 and C8 from the source data

	E	F	G
	Sum of Sales	Quarter	
Sport		Qtr3	Qtr4
Golf	\$7,930	\$2,000	
Tennis	\$4,670	\$6,500	
Grand Total	\$12,600	\$8,500	

In a PivotTable report, each column or field in your source data becomes a PivotTable field that summarizes multiple rows of information. In the preceding example, the Sport column becomes the Sport field, and each record for Golf is summarized in a single Golf item.

A value field, such as Sum of Sales, provides the values to be summarized. Cell F3 in the preceding report contains the sum of the Sales value from every row in the source data for which the Sport column contains Golf and the Quarter column contains Qtr3. By default, data in the Values area summarize the underlying source data in the PivotTable report in the following way: numeric values use the SUM function, and text values use the COUNT function.

To create a PivotTable report, you must define its source data, specify a location in the workbook, and lay out the fields. For more information, see [Create or delete a PivotTable or PivotChart report](#) and [Create and change the field layout in a PivotTable or PivotChart report](#).

Ways to work with a PivotTable report

About PivotChart reports

A PivotChart report provides a graphical representation of the data in a PivotTable report (PivotTable report: An interactive, crosstabulated Excel report that summarizes and analyzes data, such as database records, from various sources, including ones that are external to Excel.). You can change the layout and data that are displayed in a PivotChart report just as you can in a PivotTable report. A PivotChart report always has an associated PivotTable report (associated PivotTable report: The PivotTable report that supplies the source data to the PivotChart report. It is created automatically when you create a new PivotChart report. When you change the layout of either report, the other also changes.) that uses a corresponding layout. Both reports have fields that correspond to each other. When you change the position of a field in one report, the corresponding field in the other report also moves.

In addition to the series (data series: Related data points that are plotted in a chart and originate from datasheet rows or columns. Each data series in a chart has a unique color or pattern. You can plot one or more data series in a chart. Pie charts have only one data series.), categories, data markers (data marker: A bar, area, dot, slice, or other symbol in a chart that represents a single data point or value that originates from a worksheet cell. Related data markers in a chart constitute a data series.), and axes (axis: A line bordering the chart plot area used as a frame of reference for measurement. The y axis is usually the vertical axis and contains data. The x-axis is usually the horizontal axis and contains categories.) of standard charts, PivotChart reports have some specialized elements that correspond to the PivotTable report as shown in the following illustration.

Security and Privacy

Overview of security and protection in Excel

Microsoft Office Excel provides several layers of security and protection that allows you to control who can access and change your Excel data. To help protect the data in a workbook, you can do the following:

1. For optimal security, you should protect your entire workbook file with a password (password: A way to restrict access to a workbook, worksheet, or part of a worksheet. Excel passwords can be up to 255 letters, numbers, spaces, and symbols. You must type uppercase and lowercase letters correctly when you set and enter passwords.), which allows only authorized users to view or modify your data.

Lock only specific cells and ranges in a protected worksheet

1. If the worksheet is protected, do the following:
 1. On the Review tab, in the Changes group, click Unprotect Sheet.

2. Select the entire worksheet by clicking the Select All button.

3. On the Home tab, in the Font group, click the Format Cell Font dialog box launcher .

Keyboard shortcut You can also press CTRL+SHIFT+F or CTRL+1.

4. On the Protection tab, clear the Locked check box, and then click OK.

Note This unlocks all of the cells on the worksheet when you protect the worksheet.

5. In the worksheet, select just the cells that you want to lock.
6. On the Home tab, in the Font group, click the Format Cell Font dialog box launcher .

Keyboard shortcut You can also press CTRL+SHIFT+F or CTRL+1.

7. On the Protection tab, select the Locked check box, and then click OK.
8. On the Review tab, in the Changes group, click Protect Sheet.

9. Type a password for the worksheet.

Allow specific users to edit ranges in a protected worksheet

10. Select the worksheet that you want to protect.
11. On the Review tab, in the Changes group, click Allow Users to Edit Ranges.

1. Do one of the following:
 1. To add a new editable range, click New.
 2. To modify an existing editable range, select it in the Ranges unlocked by a password when sheet is protected box, and then click Modify.
 3. To delete an editable range, select it in the Ranges unlocked by a password when sheet is protected box, and then click Delete.
2. In the Title box, type the name for the range that you want to unlock.
3. In the Refers to cells box, type an equal sign (=), and then type the reference of the range that you want to unlock.
4. Tip You can also click the Collapse Dialog button, select the range in the worksheet, and then click the Collapse Dialog button again to return to the dialog box.
5. In the Range password box, type a password that allows access to the range.
6. Note The password is optional. If you don't supply a password, then any user can edit the cells.
7. Click Permissions, and then click Add.
8. In the Enter the object names to select (examples) box, type the names of the users that you want to be able to edit the ranges.

9. Tip To see how user names should be entered, click examples. To verify that the names are correct, click Check Names.
10. Click OK three times.
11. Tip If prompted for a password, type the password that you specified.
12. In the Allow Users to Edit Ranges dialog box, click Protect Sheet.
13. In the Password to unprotect sheet box, type a password, click OK, and then retype the password to confirm it.

Using passwords to help secure an entire workbook

You can help secure an entire workbook by restricting who can open and use the workbook data and by requiring a password to view or to save changes to the workbook.

Password security at the workbook level uses advanced encryption to help protect your workbook from unauthorized access. You can set a password when you save the workbook. You can specify two separate passwords that users must type to:

1. Open and view the workbook This password is encrypted to help protect your data from unauthorized access.
2. Modify the workbook This password is not encrypted and is only meant to give specific users permission to edit workbook data and to save changes to the file.

These passwords apply to the entire workbook. For optimal password security, you should always assign a password to open and view the file. To give only specific users permission to modify data, you may want to assign both passwords.

Important You should always use strong passwords that combine uppercase and lowercase letters, numbers, and symbols. Weak passwords don't mix these elements. Strong password: Y6dh!et5. Weak password: House27. Use a strong password that you can remember so that you don't have to write it down.

If you would like to remind users that the data in a workbook is important and that it should not be changed, you can have Excel recommend that the workbook should be opened as read-only. You can specify this option when you save the workbook, with or without requiring a password to open it. Users will get a read-only recommendation when they open the workbook, but they are not prevented from making changes to the workbook.

For more information on how to set passwords and read-only recommendation for a workbook, see [Set a password to open or modify a document, workbook, or presentation](#).

Protecting specific worksheet or workbook elements

When you share a workbook with other users so that you can collaborate on the data, you may want to protect data in specific worksheet or workbook elements to prevent it from being changed. You can also specify a password that users need to enter to modify specific workbook and worksheet elements that are protected.

Protecting worksheet elements

When you protect a worksheet, all cells on the worksheet are locked by default, and users cannot make any changes to a locked cell. For example, they cannot insert, modify, delete, or format data in a locked cell. You can, however, specify which elements users will be allowed to change when you protect the worksheet.

For information on how to protect worksheet elements, see [Protect worksheet or workbook elements](#).

Unlocking specific areas of a protected worksheet

Before you protect a worksheet, you can unlock the ranges that you want users to be able to change or enter data in. You can unlock cells for all users or for specific users.

For information on how to unlock cells and ranges in a protected worksheet, see [Allow cells to be edited in a protected worksheet](#).

Set a password for a document

To allow only authorized reviewers to view or modify your content, you can help secure your entire document with a password.

1. Click the Microsoft Office Button  , and then click Save As.
2. Click Tools, and then click General Options.
3. Do one or both of the following:
 1. If you want reviewers to enter a password before they can view the document, type a password in the Password to open box.
 2. If you want reviewers to enter a password before they can save changes to the document, type a password in the Password to modify box.

Notes Password to open By default, this feature uses advanced encryption. Encryption is a standard method used to help make your file more secure.

 3. Password to modify This feature does not use any encryption method. It is designed so you can collaborate with content reviewers you trust. Is not designed to help make your file more secure.
 4. Both passwords You can assign both passwords — one to access the file and one to provide specific reviewers with permission to modify its content. Make sure each password is different from the other.
4. Click OK.
5. When prompted, retype your passwords to confirm them, and then click OK.
6. Click Save.
7. If prompted, click Yes to replace the existing document.

Set a password for a workbook

To allow only authorized reviewers to view or modify your data, you can help secure your entire workbook file with a password.

1. Click the Microsoft Office Button , and then click Save As.
2. Click Tools, and then click General Options.
3. Do one or both of the following:
 1. If you want reviewers to enter a password before they can view the workbook, type a password in the Password to open box.
 2. If you want reviewers to enter a password before they can save changes to the workbook, type a password in the Password to modify box.
4. Click OK.
5. When prompted, retype your passwords to confirm them, and then click OK.
6. Click Save.
7. If prompted, click Yes to replace the existing workbook.

Set a password for a presentation

8. To allow only authorized reviewers to view or modify your content, you can help secure your entire presentation file with a password.
9. Click the Microsoft Office Button , and then click Save As.
10. Click Tools, and then click General Options.
11. Do one or both of the following:
 12. If you want reviewers to enter a password before they can view the presentation, type a password in the Password to open box.
 13. If you want reviewers to enter a password before they can save changes to the presentation, type a password in the Password to modify box.
1. Click OK.
2. When prompted, retype your passwords to confirm them, and then click OK.
3. Click Save.
4. If prompted, click Yes to replace the existing presentation.

Change a password

1. Do one or both of the following:
 1. Open the file using your open password and as read/write.
 2. Open the file using your modify password and as read/write.
2. Click the Microsoft Office Button , and then click Save As.
3. Click Tools, and then click General Options.
4. Select the existing password, and then type a new password.
5. Click OK. When prompted, retype your password to confirm it, and then click OK.
6. Click Save.
7. If prompted, click Yes to replace the existing file.

Remove a password

1. Do one or both of the following:
 1. Open the file using your open password and as read/write.
 2. Open the file using your modify password and as read/write.
2. Click the Microsoft Office Button , and then click Save As.
3. Click Tools, and then click General Options.
4. Select the password, and then press DELETE.
5. Click OK. Click Save.
6. If prompted, click Yes to replace the existing file.
7. File Recovery

Repairing a corrupted workbook

Excel cannot always start File Recovery mode automatically. If you cannot open a workbook because it has been corrupted, you can try to repair the workbook manually

Automatically save a backup copy of a workbook

1. Click the Microsoft Office Button , and then point to the arrow next to Save As.
2. Click the arrow next to Tools, and then click General Options.
3. Select the Always create backup check box.

Formulas

Functions:-By Using Functions, We Can Get Result What Ever It May Be According To Our Specifying Conditions.Functions Are Many Types,But Mainly Two Types..

1)Logical Functions.

2) Text Functions.

Logical Functions:-

1)IF-->If(Condition1,"Statement1.If_True","Statement2.If_False")

Example:-

=If(A1>B1,"A Is Big","B Is Big")

=If(A1>35,If(B1>35,If(C2>35,"Pass","Fail"),"Fail"),"Fail")

=If(E1>=60,"First",If(E1>=50,"Second",If(E1>35,"Third","Fail")))

2)AND--->And(Condition1,Condition2,Condition3)

Example:-

=And(A1>35,B1>35,C1>35)

If This And Function Condition Gets Success, It Display TRUE Otherwise False.

3)OR-->Or(Condition1,Condition2,Condition3)

Example:-

=Or(A1>35,B1>35,C1>35)

4)NOT-->Not(Condition),Prints True, If The Condition Gets Fail Else False.

=Not(A1>B1)

This Function Works Reversely, If The Condition Gets Success , It Displays False

When It Gets Failure, It Displays True.

2) Text Functions:-

=====

1) Abs --> =ABS (-5)

By Using This Function, We Can Find out The Absolute Value of the Given Specified Value.

2) Exact-->=EXACT ("SIVA","SIVA")

By Using This Function, We Can Compare The Two Specified Strings.

3) Sum-->=SUM (1, 2, 3, 4, 5)

By Using This Function, We Can Find out The Sum Value of the Specified Values Directly or by Specifying the Cell Address.

4) Average-->=AVERAGE (12, 12, 12)

By Using This Function, We Can Find out The Average Value of the Specified Values Directly or by Specifying the Cell Address.

5) Into-->=INT (12.987)

6) Dollar-->=DOLLAR (12000, 3)

It Converts A Number To Text Using Currency Format, With The Decimals Rounded To The Specified Place. The Format Used Is \$#, ##0.00_) ;(\$#, ##0.00).

7) Round-->=ROUND (1200.567, 2)

8) Trim-->=TRIM (" BDPS SOFTWARE LIMITED ")

This Function Removes The Space In Begin Of The Word And In Ending Of The Word Except Space Between The Words.

9) Ceil-->=CEILING (9.888, 2)

10) Fact-->FACT (3)

This Function Find outs The Factorial Value for the Specified Value.

11) Even-->EVEN (3.45)

This Function Converts The Specified Odd Number Into Even Number.

12) Count-->COUNT (1, 2, 3, 4, 5)

This Function Counts The Specified Values.

13) Is number-->ISNUMBER (123)

This Function Checks the Whether the Given Number Is Digit or Not. If It Founds Digits Displays True Otherwise It Displays The False.

14) Is text-->ISTEXT ("SIVA")

This Function Checks Whether The Specified Data Is String Or Not. If It Founds String Displays True Otherwise It Displays The False.

15) Left-->LEFT ("BDPS SOFTWARE LIMITED", 4)

By Using This Left Function, We Can Display The Specified Character From The Left Side.

16) Len-->LEN ("BDPS SOFTWARE LIMITED")

By Using This Len Function, We Can Find out The Length of the Specified String.

17) Lower-->LOWER ("BDPS SOFTWARE LIMITED")

By Using This Lower Function, We Can Convert The Specified Uppercase String Into Lowercase String.

18) Upper-->UPPER ("Bdps Software Limited")

By Using This Upper Function, We Can Convert The Specified Lowercase String Into Uppercase String.

19) Mid-->MID ("BDPS SOFTWARE LIMITED", 3, 5)

By Using This Mid Function, We Can Display The Specified Number Of Character From A Text String Starting At The Position You Specify.

Ans:-Ps So

20) Max-->Max (1, 2, 3, 4, 5)

By Using This Function, We Can Find out The Maximum Value from the Specified Values.

21) Min-->Min (1, 2, 3, 4, 5)

By Using This Function, We Can Find out The Minimum Value from the Specified Values

22) Mod-->Mod (3, 2)

By Using This Function, We Can Find out The Reminder Value.

23) Odd-->Odd (2.33) or Odd (2)

By Using This Function, We Can Convert The Specified Even Number Into Odd Number.

24) Right-->Right ("BDPS SOFTWARE LIMITED", 5)

By Using This Right Function, We Can Display The Specified Character From The Right Side.

25) Power-->POWER (12, 2)

By Using This Power Function, We Can Find out The Power Value for the Specified Value.

26) Concatenate--->CONCATENATE ("SIVA","KUMAR")

By Using This Function, We Can Join The Two Strings As One String.

27) Product-->PRODUCT (12, 2)

By Using This Function, We Can Find out The Product Value for the Specified Value.

28) Proper-->PROPER ("Bdps Software Limited")

By Using This Function, We Can Convert the Lowercase Text into Title case Format.

30) Trim-->TRIM (" BDPS SOFTWARE LIMITED ")

This Function Removes The Space In The Beginning Of The Word And Ending Of Word, Except Middle Space In The Sentence.

31) Rept-->REPT ("OMKARAM", 3)

3=Three Time Repeats.

This Function Repeats the Specified Word with the Specified Times.

32) Sort-->SQRT (3)

By Using This Function, We Can Find out The Square Root Value of the Specified Value.

33) Replace-->=REPLACE ("Bdps Software Limited", 6, 4,"Hard")

Old Text="Bdps Software Limited"

6=From Sixth Character Position.

4=Four Characters You Want To Replace.

By Using This Function, We Can Replace The Character With The Specified Character And Also You Can Specify No. Of Characters You Want To Replace

34) Find (Or) Search-->=FIND ("Ware","Bdps Software Limited", 1)

By Using This Function, We Can Find out The Specified the Word from the Specified Sentence.

Find Text=Ware

Within Text=Bdps Software Limited

Start_Num=1 (Means Starting Character Number.)
